this book is dedicated in recognition of the opportunity he gave the authors to experiment with new techniques in the application of the graphic arts to the newspaper

#### PREPACE

Man has been upon this planet for at least a million years. He has been able to write for some seven thousand or eight thousand years. Yet it is less than a century that he has had plentiful printing, and the real era of mass communication through the press is only about as old as the automobile. It had to wait for modern papermaking machinery and for the development of wood-pulp paper in 1840, for a rapid method of printing, made possible by the Hoe rotary press in 1845, for rapid typesetting, with the lindtype in 1884 and the monotype in 1889.

During a brief period the newspaper stood alone as mass purceyor of news Today it has powerful competitors the radio, flashing events by spoken word, the newsreel, very shortly, perhaps, television, bringing actual pictures for visual realization of what is occurring

Many of us are inclined to regard the daily paper as a fully crystallized medium of communication. The truth is, it is only somewhat less recent than the motion picture and the radio and is also undergoing rapid transformation through advances in technology.

To hold its own—and it will hold its own—the newspaper must capitalize its strength and compensate its weaknesses. It is slower than radio, it is less vivid and "actual" than the motion picture. But it is less exanescent than either of these other forms. We hear news on the air and it is gone before we digest it, we see it in the newsreel and it flashes by before we have had time to think it over. These fleeting messages command our attention but cannot remain as a stimulus to reflection. For aid to reflection we must still turn to the printed page.

What is true of news is true of advertising. The radio "commercial" captures the listener's ear but cannot put much into his mind. However, it does get his attention. One great weakness of the newspaper is that it has lagged as an attention getter. For that reason it has seen some of its advertisers flee to the region.

x

This condition has been made worse by ignorance of display in newspaper page makeup and by failure to coordinate the newspaper's editional and commercial functions. By this we do not mean to suggest an editional policy dictated by the advertising department, but newspaper planning which ensures maximum attention for news articles and for advertising alike. In the single generation in which they have served the masses, newspapers have conditioned milhons to be "front page readers," with only a small percentage who open the paper up and a still smaller number who see anything placed below the fold

As every advertising specialist knows the printed page must have more than thought content. It must have visual impact if it is to catch the reader's eye, hold his attention, and direct his interest from one item to another

Technology, which challenged the newspaper with radio and motion pictures, has recently proved its ally. It has developed photography and wirephoto, making possible the transmission of photographic news coverage almost as rapidly as word coverage. It has speeded up and immensely improved the photographic art and is opening up new possibilities at the present time through the improvement of stereotyping and pinting and the perfecting of color photography and color engraving

Widespread use of newsphotos will eventually oblige all newspapers to abandon old fashioned notions of "page spotting" by means of headline type, for modern page treatments which combine the visual units of which the page is composed—headlines, body type, photos, and, on miside pages, advertising—into treatments which are dynamic and effective. There is nothing particularly difficult about modern page treatment, but it does imply more than improved typography

It is a curious phenomenon that many newspaper editors who would not drive anything short of the latest streamlined automobile are stubbornly running newspapers reminiscent of the early American one-forse shay They say their public does not like change But this public which does not like change is increasingly getting its news, its entertainment, and its merchandising advice through mediums which advance and change rapidly

Specialists are inclined to believe that all newspapers will change greatly in the next decade. It is the purpose of this book.

to provide a broad base of knowledge with which that change can be implemented. Though the text embraces a variety of well-established skills, it represents a new and modern approach to newspaper planning and production. It was written to meet the growing need of newspaper workers and journalism schools for coursel in the practical applications of the graphic arts to their special field.

The contents of the book represent the results of a great deal of experimental work carried on at one time by a small group on the Washington Post members of every department of the newspaper, who helped in seeking better methods of presenting and coordinating reading matter, newsphotos, and advertising Special credit is due Wilham E Becker, mechanical superintendent, Samuel F Perkins, J Walter Oden, and Franklyn L Offiutt of the art department, John Caswell, engraver, Hugh Miller, chief photographer, and Louis Johrden, photographer (now chief photographer for Associated Press Photographic and Wirephoto Service for the United States), Harold Rhodenhaugh, artist and photographer (now rotogravine editor of the Louisville Courier Journal), and E J Greenwald, pinnter For the equipment specifications in Chap VIII, the authors are indebted to Louis Johrden

The authors likewise extend their thanks to Dr George Gallup, head of the Gallup Poll, Professor Herbert Brucker of Columbia University School of Journalism, Augustin Jay Powers, president of Powers Engraving, New York, and James Chankalian of the same firm, Alco-Gravure Company, New York, Wilhar Photo-Engraving Company, Inc, New York, James Wright Brown, Jr, of Editor and Publisher, Esquire Features, Inc, Chicago, Bessie Kramer and Albert L Tucker of A L Sauls Planograph Co, Washington, D C, The Associated Press, and many newspapers

#### CHAPTER I

#### SIGNIFICANCE OF NEWS PHOTOGRAPHA

#### PREVIEW QUERIES

Is today's flux of news patteres a concession to 'less literate' minds?

Is it true that radio rews bulletins and a few of televieur lend newspapers to accontinate photography—an emphasis which begin with wire-transmitted neuture or January 1, 1985?

Ideas of great thinkers—An totle 4 extharas, James 8 pragmatism, Bergson's creative evolution—filter through newspapers radio, and conversation to newspaper readers who never read a line of tratefile, James, or Bergson Similarly, strainfluing was an engine ring principle for reducing ur resistance 8 each a \$1573. It is in popular parlance, it is a comparatively new term. Most of us identify attraining with speed and the moforeer and architectural design that became widespread only shout ten very ago. Districtional news, them—picture reporting—adopt itself from an old principle in response to a base characteristic of our modern was of life?

Is picture reporting a demand of complicated living scienceextended horizons and man's broadcard thoughts and interests which now encompass the whole cuthf

With hundreds of photographs flowing into messioner affices each day by wire, mail and messenger, where are pullishers to turn for trained, picture-conscious men and women?

Indeed, of what does such training and consciousness consist?

THE modern newspaper is the an enormous hourglass which draws its materials from the far corners of the indicess, passes them through the "bottleneck" of a deadline, and scatters them to people of every degree of mit ligence and tasts

Not long ugo the product the newspaper distributed consisted almost entirely of word pictures of the world in action. Any record other than the testimony of words was regarded us a concession to less literato readers. This false viewpoint line between rapidly swept away. Editors have come to see news pictures, not merely as a means of supplementing stores with illustrative ornament but, further, for what they are the most precise, economical, and effective reporting of human events that there is

3

It once took columns of skillful writing to describe the gaiety and elegance of a social occasion, the misery and suffering entialed by a foreign war, the swift beauty of a sports combat Now a few inches of halftone on ordinary newsprint tell us the story

Newspaper executives, many of whom still regard journalism as uniquely a writing profession and photography as an unwelcome interloper in the field, are apt to helieve they lince been forced to the more pictorial presentation of the news by the competition of radio reporting, with television in the offing, and of the new sreels

The truth goes much deeper The development of modern photographic and engraving processes might not have heen so rapid and so amazing if what they had to offer had not so well answered the demand of the modern mind for a quality best described as "instantaneousness"

As living has become more complex, as the boundaries of communication have been pushed farther and farther out, until overy man's thoughts and interests encompassed the entire earth, the mental and emotional reaction has been one of stripping away all that was superfluous and cumbersome, in order to arrive at essential things as randly as possible.

In the arts, in architecture, and in the applied arts, this speed or "purism" of the modern mind has resulted in forms which the artist is apt to call "elemental" and which the everyday man dubs "streamlining". The word is a graphic one and has come to be applied to everything from a skyscraper or an automobile to the latest forms of layout for the newspaper front page Perhaps the most streamlined of all is modern thought itself. It has cast off all the curiouse of olden days and insists on arriving at beauty, at fact, and at knowledge by the shortest route

That is the surest reason why picture reporting, the "instantaneous" route to realization of the world's events, has succeeded in pushing column after column of mere words out of the daily paper. So mevitably has the transition taken place that it may be said to have happened in spite of the reluctance and opposition of men of the old newspaper school, rather than with their cooperation.

The newspaper has been impelled to try out new methods of holding its readers as it saw those readers turning for what they really wanted to the radio, to the motion picture, and, still more recently, to the picture magazines The radio news broadcast, in terse, dramatic streamlining, whisked its listener to the hot spots of the globe and told him precisely what was occurring there Often the vital news it brought him seemed lost in dreary column on column of gray newspaper type. Lacking hours to spend poring over fine writing, he might not have got the complete picture at all. And the radio did more than this for him. It brought him "flash" hulletins on hig events long before any printed newspaper could reach him. Of course what the news broadcast very seldom did was to give him all the news. Its rapid fire method hit only the high spots. It created in his mind a sort of news skeleton, which he could fill in later with the reading of a thorough newspaper account.

Yet even this joh of elahorating the news was not to remain the newspaper's sole province. The newereel, following hard on the heels of the hroadcast, often gave a kind of elahoration that was swift, detailed, and highly digestible by moderns.

There used to he much talk about the newspaper heing "doomed" as an institution. As a matter of fact it has nover heen doomed except in proportion to its inability to adapt itself to a changing function. Now, after years of obstinate resistance the journalism profession is baking up to the fact that it has lost certain things and gained others, that it has still a tremendous role to play and unlimited means for fulfilling its opportunity.

The newspaper will never again he the first source of news to its intelligent reader. He knows how to find news faster than through its columns. He knows how to realize world events more deeply and fully than through its pictures. He knows what is happening the instant it happens, and later he can hear statesmen talk, happy people laugh, and nijured people groan if he will, as the very world itself passes in swift action hefore his eves

When the thoughtful man turns from these streamlined hut exanescent forms of news communication, he still wants an organ of record, analysis, summary, in order to make his conception of news accurate and complete. But he wants this record to he streamlined too—terse, colorial writing, news photography that does a reporting joh, and page layout that serve as a swift guide to his eye and mind, not jumbled disorder of reading text and hulftones. The modern newspaper must meet these demands Often it does not do so hecause the problem itself is not clearly

understood Many editors still regard news pictures as illustration rather than as reporting and streamline presentation as a matter only of improved typography

The organization of the newspaper for its function of writing the news is traditional. The raw material for the stories which fill its columns pours into its office through a network of services extending throughout the world. Fact gathering is performed by highly trained specialists, and highly trained writers and editors handle the material after it arrives.

Consider for a moment the aspect the average newspaper office presents from the standpoint of the written news. In the city room local news gatherers and rewrite men, directed by the city editor and his assistants, are busily putting on paper the results of the harvesting of the local field. From the telegraph room come the noise and clatter of the automatic teletype machines exuding endless ribhons of copy. The telephones jungle as those still in the field—police reporters, staff reporters feature writers, suburhan news gatherers—elamor for their place in the editions. Sports writers are pounding out their impressions of the hig fight of the haschall game a "society" staff is describing the gowns worn at reception or wedding or cocktail party, editorial writers and special writers and critics and columnists of every sort are doing their personal impressions and interpretations of the news

To view all this one might be inclined to think that uords were the newspaper's unique product. Perhaps such an office has only one or two photographers and no real organization for the pictorial reporting and editing of the day's events. Yet a glance at the printed paper may show that halftone illustrations occupy a fair amount of valuable space in its columns.

On many newspapers today, picture news gathering is still regarded as incidental. The daily is illustrated with mats sent by the press associations and syndicates. The Sunday paper gives half its column space to dull calmet photographs sent in by subscribers, each of which has interest for only a small group of readers. Owing to an absence of layout, the pictures published, far from adequately illustrating the stories, may serve as a distracting element.

Chaotic conditions in respect to pictorial reporting prevail in many offices, but not in all Today the press associations are picture-conscious Machinery for gathering and distributing

newsphotos from these great agencies of news is as highly organ ized as that for the distribution of copy. The flow of pictures into the average newspaper office keeps pace with the flow of words. Pictures are taken and flashed across the continent in

Fig 1—Newsphotos compete for space with news stories. Often the picture wins because it compre see much drama into 1 tile space as when this prominent woman greeted Mrs. Roo evelt and tho late Jane Addams with a kiss.

less time than used to be required to get them from a few blocks away—pictures of war abroad and labor wars at home, pictures of disasters and floods and beroic deeds and scientific achievements and momentous happenings among the humble and the great, pictures of Hollywood doings and senside carmi als and winter sports, pictures of built mects and pize fights and baseball matches the whole panorama of our man sided lives

Such material is highly competitive with the word reporting of Reader column space in the newspaper is governed pretty strictly by the amount of advertising linage Unless advertising expands, the editor must keep his paper down to reasonable size If pictures are used, reading matter must be displaced (Fig. 1)

The editor or publisher, finding his paper swinging slowly but surely into step with the demand for pictorial news coverage, may wonder whether an organization built to serve only as a writing machine is not antiquated today. He may find on inquiry that none of his desk men is picture-conscious, that his reporters are all of a purely writing turn of mind, that no member of his staff is alive to the very urgent fact that the success of the paper must be grounded on a better knowledge of photography, engraving and reproduction processes, and the graphic arts

If he is wise, he will remodel his organization to take care of the pictorial phases of ionroalism. He will expect of his editorial staff that they reeducate themselves in the new techniques And he will turn to the journalism schools for graduates who have technical training as well as writing ability and who are possessed of a sense of the modern values in newspaper production

#### A APPLICATION EXERCISES

1 Clip from a newspaper published within the last ten days a picture which reports news instead of merely illustrating or ornamenting a news story Write a news story telling the facts which seem to you immediately clear from this picture and from its overline and underline Make your story terse and vivid, trying to give the reader with words as much of the picture's imagery, action, personality, and color as you can

2 Assuming that forty words will occupy one column inch, compute the column inches which would be required to replace in type the color, news. and interest of this nicture

3 Be prepared to discuss in class the comparative reading time, interest, and vividness in the copy you have prepared and the picture selected Evaluate the "instantaneousness" of the picture

4 Clip and mount on separate sheets of copy paper two pictures which merely illustrate or ornament news On the margin of the mounting, note briefly (a) how the picture merely ornaments or merely illustrates the news to which it pertains, (b) what sort of news picture might have been reasonably practical for the paper to have published to report this news

5 Clip and mount, as for Exercise 4, four pictures which you consider good examples of picture reporting. Note on the margin brief but specific

reasons why you consider these pictures good examples

#### B CHAPTER ORGANIZING QUESTIONS

Be prepared to discuss orally

- 1 What complexities and extended facilities for communication have brought a reader demand for streamlining of what meets eye and mind in the newspaper?
  - 2 Precisely what does "streamlining" mean?
- 3 What characteristic in human nature leads some older new spaper men to consider news photography as an interloper and a concession to superficial readers?
- 4. What, if anything, do you feel that the newsreel and news broadcast give that reader interest demands? If you think something is lacking in the news portrayal by movie and radio, would television satisfy the lack? Justify your answer
- 5 Most of the great newspaper properties of America were built to out standing success not exclusively by improving on the old journalistic tech inques, but by sensing new reader demands and new clienteles which less acute imaginations of competitiors had failed to discern. Thus, the natural history of American journalism may be more revealing than its chronological history. With this in mind, discuss new emphases in modern life and new competitors for reader interest which face newspaper publishers today. Discuss this point of view in connection with the prophecy that the "newspaper is dooned by developments in radio and movie".
  - 6 Discuss the news value of cabinet photographs
- 7 What governs the number of pages a newspaper prints? How does this space-determining factor influence the news quality and demand for reproducibility in pictures, with press associations picture-conscious and the flow of pictures into newspaper offices greatly increased?
- 8 How in general will a wise publisher meet this increased and increasing availability of pictures?

#### CHAPTER II

#### PICTURE EDITING

# PREVIEW QUERIES

When progressive demand for speed put steel bridges across vast rivers to compete with ferryboats, smart investors reorganized their stock schedules. Those who did not, sank in the gap of change. What reorganizing procedures are newspapers today using to span the flow of neturies from all corners of ext, nation, and world?

Have news and city editors taken on extra loads with the advent of meture emphasis, or have several new 100s come into editorial rooms

through the shutter of reporting cameras?

What combinations of new picture jobs can efficiently be managed on smaller papers which cannot afford as many photography executives as the metropolitan journal?

Where do newspapers get pictures which their staff photographera cannot take, their regular syndicates do not furnish, and which freelance contributors do not send them?

How does were transmission of photographs work?

Major floods last longer than spot news shots of rising water, submerged buildings, and collapsed bridges can hold major interest. What sort of pictures retain interest after the edge is gone from photographs of property damage?

How do newspapers transmit wire photographs from distant news scenes in weather in which it is impossible to fly the prints to the usual

points of distribution?

AS pictorial news coverage has taken its place beside word coverage of events, it has forced many changes in the organization of the newspaper staff. The smaller papers have put cameras in the hands of their reporters, supplementing this sort of picture reporting with the work of one or more everet sent photographers whenever this was possible. The larger papers have developed an organization for taking news and feature pictures and for editing, routing to the proper departments, and utilizing fully the stream of pictures that come in daily from the news associations and through other channels. Such an organization parallels the news and feature departments of the paper and cooperates with these at every point. The size and needs of the

individual newspaper must determine just how important its pictorial staff shall be, but even the newspaper which does not employ a single photographer can learn something from the procedure now followed on many of the larger sheets

Just as the city editor directs the reporters whose work is to cull the news from the local field, so, on the metropolitan newspaper, the studio head directs the staff of cameramen, who cover the news pictonally. In the days when few pictures were used, these cameramen were assigned from the city desk. They still are on the smaller papers, but wide use of pictures in all the departments of the paper has today made such a system impracticable on the big dailies. It insured prompt action on hig news stories, per haps, but it did not provide adequately for coverage of pictorial feature assignments, for gathering of pictures for Sunday roto and magazine pages, society, and sports, and for the needs of the advertising department.

Greater pressure on the newspaper's photographic staff brought a directing head of the studio, a man who, like the city editor kept his regular assignment sheet and knew where each of his men could be located at any time. Many studios, in addition to the record of assignments, now use a wall map of the city, with colored pins showing the spot where each man is working. The photographer calls in after finishing each assignment and before be starts back to the office. He may be able to catch a big news story that has just broken, before a photographer sent out from the studio could reach the scene. In a hig studio of this sort, one man at least is kept in the office at all times to do developing and printing, and motorcycle messengers are often used to rish plates or films in from the cameramen in the field and fresh supplies out to them.

The studio executive, with proper planning is in a position to get spot news pictures with great speed and to utilize the services of his men to greatest advantage. He will keep a "future book" or file in which he records a wide variety of assignments which can or must be made requests from the editors of the various departments for feature pictures or coverage of special events, a list of houses which must be photographed for the Sunday real estate section, conventions, club events, and sports events with the date and hour and place where they will occur. A card file arranged by dates will provide him each morning with a view of

the pictorial coverage other than spot news, which his newspaper requires for that day. The future file of the studio, in addition to its cards arranged by dates, will contain a section of suggested feature assignments and picture containities for the rotogravire or for other sections of the daily or Sunday paper. It is easy to jot an idea down on a card as it occurs and file it away for future coverage. Such ideas when kept on tap save much valuable time.

Spot news of course must be handled as it occurs, and the hetter organized the photographic studio is the faster the head will be able to get his men into action on a hig news break not keep his men in idleness in the studio, waiting for something to happen By training them to keep in constant touch, he will have them on call at any time The cameraman in such a wellplanned studio does not travel to a far distant corner of the city to get a picture for which there is no urgent need, returning several hours later with that one shot or handful of shots Instead. he starts out from the studio in the morning with a day's route carefully laid out for him and gathers as he proceeds pictures that are needed for many parts of the paper If a big news story breaks, he abandons this routine coverage and hurries to the scene Frequent calls to the studio insure his being available for spot news Smaller eameras, utilizing film instead of plates and replacing the old eumbersome equipment of the news cameraman, have of course made this sort of procedure more practical

On the large daily with an important photographic staff, the city editor's responsibility for pictures consists in notifying the studio head immediately when a news story breaks. The cameraman may call at the city desk on his way out or may telephone the city desk for further information concerning the story to which he is assigned. He may accompany a reporter, but he takes bis actual orders from the head of the studio, who is himself a "city editor for pictures". Dissatisfaction over a news assignment accidentally "muffed" may cause a city editor to attempt to assume authority over the cameramen, but where the paper is large he cannot direct the photographic staff efficiently. So far we have talked only of local picture coverage. As the

use of pictures extends to every page of the paper, and the picture material streams in from such agencies as The Associated Press.

Acme, Wide World Photos, and other services taking pictures around the globe, the newspaper making wide use of such facilities may still further expand its organization

Most large papers have a picture desk or art desk located in the city room, where pictures for each edition of the paper are dehvered from the photo studio and from the services. The man who operates this desk is in close touch with the city and managing editors as well as with the studio head, and, as soon as the editor has made his selection, he scales the pictures to their proper sizes and sends them through the art department with whatever instructions are necessary regarding retouching and engraving. His work often has to be done with great speed, and, as he is the one person in the city room who is closest to the pictures and to the news which they represent, he is usually the one best fitted to write the captions.

The picture desk on most new spapers was until recently merely a part of the etty-room machinery, and its function was only that of scaling and otherwise preparing the photographs that were to be used for daily stories. When these spot news pictures had heen handled, there remained an ever increasing number of shots which went into the discard but which could have proved useful for other parts of the paper, the women's pages, the Sunday magazine, the advertising department, and others. Some system had to be devised insuring better distribution and use of the photographs for which the newspaper was paying.

#### THE PICTURE EDITOR

Thus there has come into existence on many newspapers a new executive the picture editor (Fig. 2). The picture editor's concern is to provide art for all departments of the paper, starting with the daily news pages. He has supervisory authority over the photographic studio and over the picture desk. He cooperates with the city editor, the woman's page editor, the sports editor, the Sunday editor, and many others, offering suggestions for improving their pages and their layouts, and securing the pictures they need, either by selection from those on hand or from the newspaper morgue, or by special assignment to the photographic studio or to an outside photographer or service. A picture editor's purpose is to improve the appearance of the paper, and he can often accomplish this with great economy

simply by being in a position to see the pictorial needs of the paper as a whole and to plan for them

Of course he never loses sight of the fact that news is the backbone of the paper He is above everything a news editor for He watches the big stories that are breaking locally and metures

Fig. 2 - The ed tor handling pictures cooperates with all departments of the newspaper d rect ng the da ly flow of newsphotos into the proper channels

those that are flashing over the wires from distant points and makes sure that pictorial coverage is keeping pace with word coverage and that his paper is ready with important pictures on the deadlines A picture scoop by a rival paper can be an important thing nowadays. So his resources are often taxed to the utmost to get the pictures in in double-quick time

Though primarily concerned with news shots, the picture editor watches the stream of incoming photographs for all sorts of other He spots a picture of a local man who has won a bridge tournament in another city and routes it through to the bridge

editor He buys a photograph of a woman's club banquet submitted to bim by a local free-lance photographer or studio, because be knows that the newspaper's own cameramen did not cover this event and that the Sunday club column needs just such a shot He sorts out the sports pictures sent in by the picture services and rushes them to the sports cditor before they have had a chance to grow stale. Without his efforts, much valuable material would be wasted and the pages of the newspaper would be more dull than they need be

Many newspapers now cover world events in a daily picture page. The picture editor makes the selection for this and assignments where these are necessary. The page is usually laid out at the picture desk or in the art department under his supervision. He may write the captions for it and later make it up in the composing room.

All this may sound like an important organization for bandling newsphotos Needless to say, in many offices no such elaborate plan is needed, and several of the jobs here described may be combined into one

The first aod easiest combination is probably that which retains the post of picture editor but requires him to operato the city-room art desk limself. On a still smaller paper, he also becomes the bead of the studio. In this setup he assigns the cameramen, prepares and scales the pictures for the daily and puts them through the art department, and likewise helps to plan feature pictures and layouts for the special sections and the Sunday paper. If facilities are still more restricted, he may be required to do the retouching, on papers which do not employ a regular art-department staff. He theo does all the physical work of scaling the pictures, making layouts, writing captions, and seeing that the pictorial copy is properly handled by the engraving plant.

The picture editor's post, whether the paper be large or small, is an important one. It requires a man with keen news sense writing ability, knowledge of photography and cograving, and much of the technical skill of the art-department worker. He is the haison officer for many departments and the center of pictorial reporting for the newspaper.

But what of the paper which has practically no photographic facilities, yet which still uses pictures? There are many news-

papers which employ only one or two photographers, and many others which have no professional photographers at all. These papers receive pictures from the press associations, they may have reporters who do double duty as cameramen, and they probably use as well a great many photographs of local citizens and events, submitted to the editors either by the readers themselves or by professional photographers in the town

Often the handling of pictures on such newspapers is very badly managed and as a result editorial workers come to regard the photographs published in the paper as having little importance A survey of the column space these pictures occupy and the reader interest they arouse—or fail to arouse—may convince the editor that the white space is heing poorly utilized

In learning from the metropolitan newspapers the editor must remember one thing most of the functions of the studio head, tho arti-desk man, and the picture editor must somehow or other bo filled if the appearance of the pages is to be improved. However, he may not create any of these posts, the managing editor may supervise the picture situation himself. He will plan better art for the various parts of the paper, make assignments or suggestions to the reporters who use cameras, arrange with local photographers to hing in pictures of a more lively and interesting-ort than formerly, sort over daily the photos from the press association services, educate the other members of the editorial staff to be picture-conscious, and thus, in many directions, take the neture problem in hand.

Or he may employ a picture editor-photographer, who will fulfill all these functions and take some local pictures as well

Or he may make a member of the editorial staff who is pictureminded responsible for the whole picture situation, under his own close supervision, while relying on his reporters who use cameras for local news coverage

Many plans are possible, but one step seems advisable Centralize the handling of pictures on the paper as far as possible The editor of each section will wish to handle and select the photographs for his pages, and he should do so whenever he can show results, but all departments need the cooperation of one person to help them to secure pictures from outside sources, from the services, and from the cameramen on the paper The city editor may he able to handle the whole picture situation for the newspaper successfully and often is required to do so. But he is not apt to see the problem as any except one of getting photographs for the higgest news stores. He can hardly he expected to apply initiative to the task of getting hetter art for the Sunday society section or the sports pages, for instance. Ohviously this means enlarging his work outside the useful houndaries his position implies.

Unless the managing editor performs the function of picture editor himself, he should assign it to someone who will work closely with the city desk on news coverage but who will know that his duties touch all departments of the paper

#### Sources of Newsphotos

Such a man will not only distribute wisely all pictures arriving through the normal channels but will be familiar with all possible sources of pictures, so that he can secure whatever is needed promotly at any time

Roughly classified, these picture sources are as follows

Newspaper cameramen

Local commercial and portrait studios Local amsteur photographers Newsphoto services, which supply

Photos hy mail service

Wirephotos
Picture mat service

Picture agencies, which specialize in

Feature pictures

Historical pictures Foreign pictures

Professional free lance photographers

Taking pictures on order

Specializing in certain classes of pictures

Professional color photographers

National advertising agencies, which can furnish

Travel pictures

Industrial pictures

Fashion pictures, and many other special subjects

Publicity pictures from

Hollywood studios and their eastern representatives

Radio broadcasting companies

Airlines

Chambers of commerce, which will furnish

Scenic views of their municipality and region

United States Government departments

Army and Navy departments have huge picture files

Other departments can furnish pictures on scientific subjects, bird and animal life, housing farm conditions, soil conservation, engineering projects, etc

Public library
Pictures in books can be photographed

Picture collection

Newspaper s morgue

Pictures from all sources have been classified and filed here

Other newspapers

Local and out-of town papers often consent to sell pictures. News and picture magazines which

May result special feature pictures which they published exclusively.

Art galleries and museums which

Furnish free or sell photos of psintings on exhibition

Foreign chambers of commerce in New York, which

Give or sell many feature pictures showing activities of all natures in various lands—French Chamber of Commerce for France, Amtorg for Russia. etc

Corporations industries, railroads, etc., which

Can be written to directly for pictures they may have, on such subjects as auto manufacture, steelwork, lumbering, etc

In connection with these picture sources, the student will find a hist of addresses of services, agencies, and photographers in the Editor and Publisher Year Book, but this should be considered merely as suggestive The picture editor should build up his own card file of picture sources he may need to call upon, with notes on the type of photos each can supply

#### WIREPHOTOS

We have mentioned a number of important sources of newsphotos and feature pictures, to which the picture editor will have recourse at various times to fill the needs of the many departments of his paper Undoubtedly the greatest sources of news in picture form are today and will continue to he the organizations which service photos by wire The modern technical advance

which has made it possible for pictures of news events to flash across the wires with the same speed as verbal messages from one side of the continent to the other, has counted for more than any other single factor in making photographic news reporting practical

The system was perfected by engineers of the Bell Telephone Laboratories of New York, and was first put into operation by The Associated Press on January 1,1935 for the sending of a daily picture service by wire. This service today minitains a regular network covering 10 000 miles of wire and delivers to new spapers in its organization pictures of outstanding news events within a few hours after they occur. Portable photo-sending machines using ordinary telephone wire for transmissions have been used consistently now since the spring of 1936, and portable receiving sets since August, 1937, principally by new sphoto services and more frequently of late by individual new spapers. The newspapers must lease their machines from one of the systems maintained by newsphoto services. By means of these machines newspapers in large cities or covering a large area can now telephone their own pictures into the office from the outlying districts

Most of these pertable machines will send a 7 by 9 print from which a 7 by 9 negative is received. One newsphote service, however, uses a portable machine which sends a 4 by 5 print which is enlarged during transmission so that an 8 by 10 negative is received. These machines have proved themselves invaluable in weather where it would be impossible to fly prints or negatives to points of distribution or in obtaining prints from inaccessible

areas

#### How Wirephoto Works

Frank B Noyes, president of The Associated Press, said of wrepfioto at the time of its inauguration that it was "perhaps the most important development in journalism since the first news dispatch was sent over a telegraph wire in 1846." And he added

A dream cherished by newspapers for many years is realized. Story and picture travel side by side over the wires and into the pages of the daily newspaper. Wirephotos join the printed word to tell the news more rapidly more graphically more completely and with the honesty and fairness of the camers.

To understand how wirephoto works, one must forget that a photograph represents a seene or image of real life and see it instead as a surface with varying tone values. If this surface were divided up into thousands of tiny squares, each square would reflect a measurable degree of light. Each minute square, the light it reflected were converted into an electric impulse, could travel as an independent message across the wires to a distant point. If on arrival it were reconverted into light which caused an exposure on a negative, it would reproduce its original stofe value. If the thousands of tiny squares into which the original surface had been divided were thus transmitted in regular sequence, causing exposures in the same order on the negative at the receiving end, a complete negative of the original would be obtained.

That, in a general way, is the idea behind wirephoto A beam of light  $\mathcal{H}_{00}$  in square strikes the upper left-hand corner of the newsphoto print that is to be transmitted and is reflected from the tmy square on the picture to a photoelectric cell. The tone value of that particular square of the picture will determine how much light is reflected, dark tones reflecting little, lighter tones more

The photoelectric cell is able to convert light into electricity, which is transmitted by wire. If a small amount of light is reflected to the cell it is converted into a weak current, while a larger amount of light results in a strong current. The strength of the current will in every case, then, be proportionate to the tone value of the square from which the light was reflected.

When the electrical impulse from the first little square arrives at the receiving end, it operates a shutter which opens to a width proportionate to the strength of the current. The opening of this shutter exposes the portion of the receiving negative which corresponds to the square heigh transmitted. If the current is strong, it will open the shutter for a full exposure, if weak, it will permit less light to strike the negative. On any particular square of the negative the exposure will reproduce the value of tone of the original square.

As soon as the first square has heen registered, a second follows, until the whole receiving negative has heen exposed in varying degrees over its entire surface. The negative can then be developed and printed to obtain a print exactly like the original

In the actual transmission of a wirephoto, the original picture and the receiving negative are placed on revolving cylinders, perfectly synchronized in their motion. These cylinders revolve at a speed of 100 revolutions per minute, so that the light heam travels rapidly over the surface of the original in spiral fashion, transmitting one tiny square after another to the photoelectric cell, thence over the wire to be recorded on the negative at the other end. Eleven square inches of a photograph are transmitted in one minute.

In each of the cities where it maintains a permanent wirephoto station, The Associated Press has an equipment room with a special power plant. Each city is equipped with a sending and receiving apparatus, with a "hay 'or switchboard for each. This bay contains a talking circuit by means of which the men in clarge at all the different points of the national network can engage in conversation, talk over the newsphotos each has to transmit, and determine which pictures should take precedence Finally a signal from the control station in New York serves as a warning that transmission is about to begin. A few seconds later a hutton is pressed on the sending machine, which instantly starts all the receivers in the network.

The receiving machine in every station is loaded with a negative which can receive any size picture up to 11 by 17 in. This negative is fastened around the cylinder in a lightproof container and is exposed to light from a lump focused through an aperture or shutter 1/100 in wide, which remains nearly closed when the area of the original being transmitted is very dark, but opens wide when the area in transmission is very light

The development of the portable wirephoto sending and receiving sets almost immediately doubled the field of this method of picture reporting and is rapidly making it available in every picture reporting and is rapidly making it available in every corner of the nation, however remote Both the portable transmitter and the receiver will operate on any telephone circuit and on any available electric current. The receiver, which is no larger than a radio cabinet, is designed to eliminate the necessity for a control hay No synchronization is needed between stations, since the mechanism operates at a speed which is constant.

In the short space of time in which wirephoto reporting of the news has operated there has been a great advance in the quality of the pictures produced The earliest pictures were marred to some extent by the fact that the scanning lines caused by the light beam which transmitted the picture were visible in the final print Today these lines are imperceptible to the naked eye, and photos received are as good in tone values as those that were put on the ware.

Another cause for improvement can be found not in the mechanism of transmission and reception but in the increased picture-conseiousness and skill of men on newspapers everywhere who have been affected by this vast organization for picture dissemination. One of the early weaknesses of wirephoto lay in the fact that many of the pictures taken and put on the wires by immelier papers were neither good news nor good photography. That is hardly the case today. Let it is evident that the greater the photographic skill on all newspapers, the better will be the crop of pictures received by all. The small town cameraman perhaps has more incentive today than formerly. Big news may strike anywhere and he may easily be the one to take the newsphotos which will be the national sensation of the year.

The Associated Press has greatly improved its organization for pictorial news coverage and now has highly skilled photographers at strategic points throughout the country ready to fly, with portable sending apparatus and sometimes with portable darknown to the seene of any big news story. Wide World is likewise covering the country with portables for the most part mounted on trucks, from which transmission can be made

Something of the romance and bumor of this great new science and profession of pictorial reporting is recounted by Louis Johrden chief photographer of The Associated Press Wirephoto network, who has been instrumental in training and organizing expert cameramen for this service throughout the country Johrden recounts the following medients in connection with wirephoto coverage of big news

A newsphoto-service cameraman was sent to a certain bureau to fill in for the regular photographer there who had been sent on a long assignment outside his area. He had a late assignment that evening and had just finished getting out his print service, when he received a telegram from the New York office to stand by for a quick trip on a mine disaster story. The technician who operated the portable wirephoto machine was summoned and the photographer gathered equipment and supplies for almost anything he might encounter on the assignment Another telegram confirming the assignment came through shortly, and technician and photographer were on their way in their auto with the portable machine, cameras, trays, paper, etc

The distance to their destination was about 180 miles over mountain our roads on a winter night. The trip ended in the town nearest the mine at 11 o'clock the next morning. As they drove into town, they beaded for a sign indicating that a combination florist-photographer was in husiness. An unusual tie-up, but they needed a phone line and darkroom. The deal for use of both was completed in three minutes.

The technician stayed to hook up his set and make preliminary tests for sending, while the photographer started the 11-mile journey from the town up a creek to the mouth of the mine Luck was with him. He had been at the mine ten minutes just long enough in take a few general views and pictures of those in charge of rescue operations, when the first bodies were brought to the surface. There were 19 dead but the cave-in was so complete only two bodies could be brought to the surface at a time. The photographer made his shots of the first hodies heing carried from the mouth of the mine by rescue workers and then took up his position to get human interest pictures women crying others with stony faces as if stunned, children pulling on their mothers' skirts innocent and wondering

In less than an bour he had made his bave shota and returned to the florist's cellar, which was misinamed a darkroom. It was hardly dark neough for the fast panchromatic materials used by the news photog rapher, but nothing better existed. He developed fourteen negatives in a tray, shielding it as best he could with his coat. How did he time them with no inspection light or timer clock? The technician, located with the portable wirephoto machine in a bedroom on the first floor above kicked on the floor when the five minutes had expired, otherwise the photographer would have bad to count to 300 as accurately as he could time it to seconds.

The florist-photographer's enlarger was a marvel By pinning the enlarging paper on the easel with corsage pins appropriated from the florist part of the establishment, it was possible to expose a print. The enlarger could not be used to print wet negatives, because of the way in which the negatives must be held in the machine. They had to be wedged in A trip to the corner drugstore produced a small hair-drying machine which dried the negatives in record time.

A print was made, captioned, and started in transmission on the portable machine in the bedroom. While this transmission was in progress the other prints were made and captioned ready for transmission. A total of six transmissions was made and reported as satisfactory

One opposition newsphoto service used a different method on this particular story They elected to fly a regular photographer into the The nearest landing field proved too small for the plane to get The pilot wheeled to avoid hitting trees at the edge into successfully of the clearing but the ground with the tip of one of the wings and tore away the fabric The photographer obtained a ride into town while the pilot was effecting the repairs but by the time he had got his shots and returned it was dusk and the pilot reasoned that if he could not get into the field by daylight be could scarcely get out by dark They decided to wait for dawn to take off a logical enough plan, but one which worked out disastrously for them since the following morning it was sleeting and snowing and the take-off was impossible. The photographer was obliged to travel back by train with his precious negatives. and arrived a day after the wirephotos had been published throughout the nation

It is true that the photographer and technician with the portable wireplusto machine were likewise maroned by the blizzard. When their complete coverage of the story had been put on the wire the next day, they spent two days in see and snow on mountain roads. But they had under their belt? one of these things which becomes more rare every day—a scoop? Wirephoto had transmitted the only pictures which would reach the nation for the next 48 hours.

#### THE FLOOD STORY BY WIREPHOTO

Johrden gives another example of how a modern newsphoto service "goes over the top" on a spot news story of national importance. The story concerns the floods which engulied the Ohio Valley in the spring of 1937. It was a story of such magnitude and embraced so many major cities, taking toll of lives and causing millions of dollars' worth of damages, that it affords an excellent example of large-scale pictorial reporting. Johrden recounts

When the first high water made its appearance and on strength of predictions from the weather bureau although the regularly assigned man was already on the job in that are two ertic exmerance, one exclusively a photographer and the other a cameraman-editor, were flown into the flooded area, with their base at the principal city. The editor's job was to supervise the operations of the two "leg" men, develop and print the service, write captions for both the mail service and the portable picture-sending machine, expedite all the negatives to the nearest point of distribution for reservice, and cover any angles of the story he could, without leaving he other duties unattended to

As the flood erest moved along and more areas became inundated and transportation facilities paralyzed, more men were sent, not only into estimate areas, but also to those towns where extensive preparations were being made to combat "old man river". By the time the height of the flood was reached, approximately, 20 cameramen were spread out over an area extending from Pittsburgh, Pa, to St Lous, Mo Several editors and portable picture sending machines were also out on the line of action by this time

The problem of keeping all these men supplied with materials as well as money and proper clothing then presented itself. Transportation was at a standstill. There was only one means—to fly. Flims, bulbs, paper, boots, heavy clothing, money, candles (since power was cut off), flashbghts, and even drinking water were sent in by plane to the marooned staffs, and the exposed negatives were flown to points where national mail or further wire distribution could be necomplished. To keep pace with expected developments in the flood, extra supplies were sent into the etties expected to have excessively high water.

After the first few days of the flood, the "edge" had been taken off views showing just high water, and the photographers were instructed to bear down on human interest shots of animals, refugees, and rescue workers, plus oaly outstanding views of high water and rescue operations. This order brought forth some clever composition on the part of the photographers, and several photos resulted which were so striking they received nation-wide publication and acclaim and will stand up for many years as among the best newsphotos of their time

Thus, by perfect coordination between the cameramen and editors in the field and the desk men who "rode the report" in the home office, miles from the flooded area, a picture story was made available to readers of newspapers in the modern manner—that is, fresh pictures each day to report the day's latest chapter of the news

These dramate instances of picture reporting have been included in this book, not only because they throw light on the romantic elements of newsphoto coverage, but also because they show to some extent the development of a new profession and the kind of training which will be needed in the future by men who hope to use to the top in this new journalistic career

It is evident that a great new organization for news coverage has sprung up, virtually overnight, the twin to the organization which existed for written news coverage. Such a pictorial newsgathering machinery requires men who know a great deal more than how to snap a picture. They must be trained to take pictures and to judge pictures for their news values and as copy Suppose you were planning such a paper for a farm county in your state List ten hypothetical pictures you would try to get for next week's issue

6 To what office in the county seat would you go to get tips on farm news, conditions, or changes for such nictures?

7 If you wished to secure for such a county farm tabloid photographs reporting government methods used on soil conservation or on farm conditions, without going to the expense of sending a photographer out especially to take them, where might you try to get them?

8 If you wished to print pictures of the new farm housing organization in Germany or of central farming conditions in the Soviet Union, where would

you seek them?

9 The Missouri weekly described in Exercise 5 decided to publish a picture of its first issue in 1819 and a picture of its issue reporting Lincoln's assassination. However, the paper had no office files extending that far back. To what customary source did it probably go to get these pictures to reproduce?

# B CHAPTER ORGANIZING QUESTIONS

Be prepared to discuss the following questions orally

1 In what three ways do small papers, unable to afford full time staff photographers get local pictures? Where do they get pictures of national and international news?

2 What objection is there to the small daily's common practice of assigning the pressroom foreman to make up the weekly picture page from a heap of syndrest mats?

3 What is an objection to having a city editor handle all pictures for a paper?

4 On large papers, where is the picture or art desk located, and what is its function?

5 What inefficient condition developed early on papers handling many pictures which led to the creation of the position of picture editor?

6 To what news executive does the picture editor (not the studio head) correspond?

7 List at least eight duties of the picture editor

8 On somewhat smaller papers, what three combinations may be made with the position of picture editor to save mone;?

9 On papers which are too small to afford any full time staff photog raphers but which receive pictures from press associations and syndicates what office organization is advisable to utilize most effectively the space occupied by pictures?

10 To illustrate movie and aviation pages more fully than pictures supplied from local theater managers will permit, what picture sources can

be tapped?

11 A few years ago when pictures were largely used to illustrate and ornament a disaster at a distant mme would normally have been illustrated by pictures of the mine shaft taken weeks or months before and a cabinet photograph of the man in charge of the rescue work. How did science unprove upon this illustrative method in the case of a recent disaster?

to be reproduced by photoengraving processes and printed; they must have executive ability and writing ability. They must have a thorough knowledge of all the uses to which nowsphotos are put, so as to be able to supply all existing needs. In other words, they must know something about all departments of the newspaper, all methods of reproduction, and the kind of pictures which are appropriate in every instance.

The big men in the newsphoto services got their first training on local newspapers. And today the smaller papers are indispensable links in the great national systems of pictorial reporting. These papers need good photographers and an organization enumped to handle newsphotos in their territory.

#### A. APPLICATION EXERCISES

1 Select a copy of a daily newspaper, at least 16 pages, published within the last month at a town or city in which you are familiar with the principal streets and locations. Exeluding spot news stories, list ten pictures actually published, or pictures which might well have been published, in that issue to report feature, real estate, local motorar, society, industrial, or advertising news. Make out an assignment route for a staff photographer to follow in making these "shots" with least loss of time.

2 Who, in a metropolitan newspaper organization, would make such an assignment and routing? To what news executive would the photography

executive making this assignment correspond?

3 Choose a local spot news story in your selected paper which broke unexpectedly Assuming that all the piper's photographers are out on routine assignments, explain what facilities should exist in the office for getting pictures of this spot news as quickly as practicable

4 From the columns of this paper, list five good picture possibilities which you would put in a "future book," if you were the studio executive

5 In Missouri in 1938, a famous weekly newspaper, 119 years old, faced financial failure because road improvements were distributing metropolitan papers into its county field and two strong small town dailes bud grown up in its area. This weekly had been edited, one time or another, by three nationally known Missourians. It had a fine bentage, tremendous potential good will, but insufficient interest to meet its competition. Many said its field and its mission were played out. Its publishers owned a splendidij equipped print shop with a \$6000 photoengraving plant. They decided to turn the paper into a country tabloid five 14-in columns for each of 16 pages, with from 30 to 40 news patures of local country news in each issue Except for three signed local columns and the country correspondence, all mess was local and was reported with pictures, overlanes, and underlines Half column cuts were run of columnists and country correspondents. At present the paper is succeeding

Suppose you were planning such a paper for a farm county in your state. List ten hypothetical pictures you would try to get for next week a issue

- 6 To what office in the county seat would you go to get tips on farm news, conditions, or changes for such pictures?
- 7 If you wished to secure for such a county farm tabloid photographs reporting government methods used on soil conservation or on farm conditions, without going to the expense of sending a photographer out especially to take them, where might you try to get them?
- 8 If you wished to print pictures of the new farm housing organization in Germany or of central farming conditions in the Soviet Union, where would you seek them?
- 9 The Missouri weekly described in Exercise 5 decided to publish a picture of its first issue in 1819 and a picture of its issue reporting Lincola's assassination. However, the paper had no office files extending that far back. To what customary source did it probably go to get these pictures to remoduce?

#### B CHAPTER ORGANIZING QUESTIONS

Be prepared to discuss the following questions orally

- 1 In what three ways do small papers, unable to sfford full time staff photographers get local pictures? Where do they get pictures of national and international news.
- 2 What objection is there to the small daily's common practice of assigning the preseroom foreman to make up the weekly picture page from a hesp of syndicate mats?
- 3 What is an objection to having a city editor bandle all pictures for a paper?
- 4 On large papers, where is the picture or art desk located, and what is its function?
- 5 What mefficient condition developed early on papers handling many
- pictures which led to the creation of the position of picture editor?

  6 To what news executive does the picture editor (not the studio head) correspond?
  - 7 List at least eight duties of the picture editor
- 8 On somewhat smaller papers what three combinations may be made with the position of picture editor to save mone;?
- 9 On papers which are too small to afford any full time staff photog raphers but which receive pictures from press associations and syndicates what office organization is advisable to utilize most effectively the space occupied by inclines?
- 19 To illustrate movie and aviation pages more fully than pictures supplied from local theater managers will permit, what picture sources can be tapped?
- If A few years ago when pictures were largely used to illustrate and ornament, a dissaster at a distant mine would normally have been illustrated by pictures of the mine shaft taken weeks or months before and a cabinet photograph of the man in charge of the rescue work. How did science improve upon this illustrative method in the case of a recent disaster?

- 12 Explain the function of the photoelectric cell in wirephoto transmission 13 Explain how the varying tone values in a photograph are transmitted
- to distant points to make a wirephoto 14 What development available since August, 1937, has added greatly
- to news picture enterprise?

#### CHAPTER III

#### JUDGING NEWSPHOTOS

# PREVIEW QUERIES

Approximately 12,800 photographs each week reach the desks of Life magazine Of these, between 2.00 and 300 finally get into print Of 3 000 negatives made for a senses, or 'picture story," 30 were published Many newspriers cannot afford quite so high a proportion of "chaff," but every picture editors eye must be quickly and keenly selective What principles, consciously or unconsciously, govern accentance or rejection?

By what editoral formula would a clear, reproducible print of a \$20,000 painting owned by n local millionaire be rejected by an editor who the same day rated a picture of five unidentified Negroes photographed everal hundred miles away as one of the most widely interesting news shots of the year?

How may the picture of a statue or the lacade of a new building be given the reader appeal of "motion" by the position of the camera? What have the pupils of an object's eye, or the appearance of cur tains at a window, to do with judging certain news photographs?

When is a picture of Red Cross nurses near the front lines in France not a news picture at all? When is the same picture for the same newspaper in the same year a decidedly good news picture?

Suppose a local theater burns Some persons are killed, others narrowly escape After all available pictures of this fire and its after math have been printed, how may a picture editor satisfy a public appetite for pictures linked with the fire?

THE product of news cameras must be carefully selected and clited, if photography is in dn its job of reporting events so the newspaper picture editor scans the stream of "art" as critically as the telegraph editor does the copy coming over the wire or the city editor the stories handed him by reporters. And he may have httle time to make his selections. With editions coming up and picture deadlines to neet, with big stories to be covered and photographs arriving constantly, he must be prepared to make his choices at top speed, yet always make them correctly. For this he develops certain standards of judgment,

which at first he observes consciously but which soon become part of the automatic functioning of his mind. When that point has been reached, he may be said to have acquired a "picture sense"

On the road to this picture sense, two classes of values must be kept in mind. We judge a picture first for its essential value, or content. Secondly, we judge its value as copy, how well it will reproduce on newsprint. Content and copy story value and reproduction value. These are the mainstays on which must rest all intelligent selection of news pictures.

The beginner will find useful a simple method of grading each photograph in order to discover whether it belongs in the news pages of the paper. The picture is first rated for content on a 100 per cent basis, of which 33½ per cent is given for the importance of the personality involved 33½ per cent for the news it reports and 33½ per cent for the amount of action portrayed No photograph is acceptable in the news columns unless it attains a rating of 60 per cent (Fig. 3).

Let us see how this works out Suppose we have a photograph of the President of the United States, scated at his desk in the Winte House putting his signature on an important piece of legislation which may affect the future of the country. His pen is poised over the paper, while a group of prominent advisers watch. The President is a highly interesting news figure, and therefore on this count—the importance of the person—we can put down the full 33½ per cent. As news the shot also rates 33½ But on action it takes a drop. It is not a still life—there is considerable animation in the scene—but neither is it as full of motion as the picture of a prize fighter delivering the knockout blow. On the count of action, a generous estimate might give it 20 instead of 33½. On the three counts then, this picture totals 86% per cent, or far above the 60 it needed to be used.

I et us imagine the photo following this one is of an entirely different sort. It shows the deck of a sinking biner at sea. Members of the crew and prissengers are rushing to adjust his preservers before plunging into the occan. Such was the subject of one of the greatest news pictures ever made a camera shot supped during the sinking of the "58 Vestris".

Remarkable as the picture is, it rates zero on the first count importance of the persons shown But it gets 333% for news and

Fig 3—Action—personality—news value This could shot of Pres dent Roosevelt delivering an important message to Congress has all three essentials

331/3 for action, or drama It is easily a picture for the front page

The amazing frontispiece shot of the explosion of the German dirighle Hindenhurg at Lakehurst rates 66% for content, since no important persons are shown. The beginner making use of this method should therefore realize that a rating of 66% may indicate a picture of major news value. On the other hand no picture which cannot reach the 60 mark will be worth publication.

A photograph of a prominent citizen playing leap frog on the sands of a summer resort may rate very low—say, 5 per cent on news value, the news that he is on vacation. Yet his importance in the community where the paper is published and the liveliness of the nose may give it the total it needs to make the paper.

A hust or cabinet photograph of a bank president mysteriously kidnaped or murdered shows an action rating of zero, but 331/3 on personality and 331/4 on news

The novice will find that daily practice in rating pictures for their content, on the three counts of personality, news, and action, will soon give him great facility in judging newsphotos and will help him to avoid many common blunders in picture selection

Take for instance the case of the constant reader who sends the editor a snapshot of his pet spanel, with a request that it be published. If the dog is a thoroughbred and the newspaper runs a pet column, the shot may find its place there. But for the news columns it is definitely out, as a quick rating will show. It gets zero for news, zero for action, zero for personalty.

If the dog just won a blue ribbon in a local show and is photographed wearing its mark of distinction as it jumps up to greet its prominent master, the rating changes so much that it is now excellent pictorial material. Thus each separate shot must be rated by itself.

Examples could be multiplied, but the rule should be clear Judged for content, a photo may lack one of the three essential values personality, news, and action. If it lacks two it is ruled out of the news columns. At this point, however, the student should stop to consider whether he understands thoroughly what each of these three values implies

On the first count, personality, he will probably have little difficulty in distinguishing the people who are important in his own community and in the world at large (Fig. 4). In order not

to overlook important pictures, he will keep his own background of current events constantly up to date, will follow carefully all the stories that are running in his own and other newspapers, and will have a watchful eve always on big news that is breaking

Fig 4 -People may be important locally nationally or internationally bigger the celebraties the better the public likes to catch them off guard

The better informed he is in many fields, the less likely he will be to make the mistake of not recognizing an important face or name

# RECOGNIZING NEWS VALUES

The news rating, too requires careful consideration, because any misconception of what news is will lead to possible error

The hig spot news photo is hard to miss. It is the shot of the local theater burning down, the prominent society woman killed in an automobile crash, the flood or disaster taking hundreds of lives, the Presidential inauguration, the labor riot or the national convention of financiers or war veterans

As with news stories so with pictures, the farther from the local scene the event occurs, the bigger it must be to possess interest for the local reader A small incident occurring on the city's

principal boulevard may be worth Page One, but if it happened in some other city, it may not be worth considering

All news, near or far, concerns four great elemental human themes Survival, sex, ambition, and escape These are the four great motives or instincts, which form the pattern of man's existence on this earth His interest is at once aroused by anything which invokes them

Of the four, survival is perhaps the most elemental The struggle to keep alive and to go on living has been in progress since the first savage wrapped himself in animal pelts, warmed himself before a fire, or nourished himself on the flesh of the creature he had slain. Newsphotos that invoke the survival instinct are sure of appeal. That is why people look at pictures of an airplane crash, a fire, a flood or a catastrophe of any kind It is why they are interested in pictures having to do with some crime which endangered life It is why they are concerned with pictures of famine-ridden people, of foreign wars, of strikes for hetter living conditions The survival instinct may be aroused by a picture having to do with sudden death or by one which tells a dramatic story of everyday struggle for food and shelter may make a great news picture out of a poor Negro's lynching, or a tenement mother and her children receiving a hasket of Christmas food, or a gang of humble laborers toiling to heap sandhags into a wall to hold back the turbulent river threatening to engulf a town

Surmal-or anything which threatens it-is news

Next to survival, sex is probably the second great human interest. Translated into news pictures, it implies intense public interest in romances, in engagements, in weddings, and in divorces. It brings many widely different pictures within the category of news, from the kiss of two prominent movie stars to photographs of the principals in a crime of jealousy. Pictures of babies probably have their tremendous emotional pull because they tend to combine appeal to the romantic or sex instinct and to the survival instinct, which becomes a protective sense where it affects those who are helpless.

Sex-romance, love, and hate-is news

Third of these great pillars of the news is the ambition theme the appeal to man's urge to surpass his fellows, to gain power, to be an important person in wealth or in influence over the lives of others Ambition takes in the whole arena of the business world, of politics, of scientific, social, and many other forms of achievement. The appeal to this instinct to reach the top of the human pile accounts for the fact that the humblest factory worker may study over news shots of a great society event or that entirens of a great democracy may clamor avidly for photos depicting life in a royal castle. Pictures of the Duke of Windsor and his bride, the former Wallis Warfield, an American born commoner, had a twofold appeal to the romantic instinct and to the instinct of ambition.

Ambition—getting to the top—is news.

Fourth of the forms of news appeal in pictures is escape Never quite content with the spot on earth where he must live, man longs insatiably for change, for adventure, for fun and glamour and everything which will give him momentary respite from the struggle for existence. He may never take off in his own sirplane sail his own yacht in a cup race, knock out the world's heavy wight champion, sing in grand opera while thousands listen, or conquer the heights in Hollywood. But he will experience keen delight in sharing the experiences and following the latest exploits of those who have done these things. Pictures of a horse race, an expedition to the North Pole, a flight across the Atlantic, provide happy escape thrills. Newsphotos with the escape interest may be sports shots, or movie shots, or adventure and exploration, or photographs having to do with the fine arts, radio or the screen. The variety is almost endless, but the test is sure

Escape-adventure, prowess, and daring-is news

### RECOGNIZING ACTION

So far we have considered the first two of the three essentials to be looked for in the content of any news photograph, personal ity and news What of the third of these essentials action? The person attempting to judge pictures must be sure that he knows just what this requirement implies

Usually we think of action as something having to do with actual physical or bodily motion a child running, a prize fighter battling his opponent, a hasehall pitcher throwing the hall, a fireman dragging victims out of the flames, a horseman leaping a hurdle. Or it may he an airplane doing a nose dive or an ocean liner sliding down the runway or plowing through the waves

Such scenes spell action to everybody's mind Motion is action (Fig. 5)

Not so long ago newspaper people dealing with photographs discovered another sort of action which was thrilling action in the human face. The fast lens of the so-called candid camera had made this more subtle form of action available. The drama of facial expression should never be overlooked as a high form of anoteal in newsphotos (Fig. 6).

Thus the senator caught in a close up, shouting and gesticulating as he urges the passage of a bill is far more interesting to the public than the same man would be in an impassive studio portrait. The face of a child with terror stamped upon it may give the newspaper reader a better conception of a school fire than columns of wordy eloquence. All emotions have a dynamic quality, and the newsphoto which depicts emotion has the quality of action even if the person photographed is sitting still Emotion: is action

In this connection it is well to point out the editorial power the picture editor exercises in his selection of a candid camera shot A grotesque facial expression, caught by the camera's eye, may cause ridicule, whereas a more ingratiating close up would have won instant friendliness. Many photographs of political figures are deliberately chosen for their sympathetic appeal or for their cartoon value (Fig. 6)

Two places where better use could be made of candid camera material are the society and Sunday pages Stiffly posed cabinet portraits still conspire to make the woman's pages dull. This is because such portraits are sent in by subscribers or furnished by local studios, and the editor follows the line of least resistance in utilizing them. Their low reader appeal makes them little more than space fillers Reader reaction is always keen when such pages show candid camera shots which reveal the glamour and laughter and elegance and drams of the smart set or the local residents in action. And many a local photographer, in return for a published credit line, is glad to take pictures of social exents and parties and furnish them to the paper free or at nominal cost The newspaper's own photographers and reporters may sometimes be available for taking such shots or these may even he secured from the readers themselves if a little educational work regarding society pictures is first carried on

And sports provide the news photographer with material for some of his most dramatic action shots Photo by John Mills Jr Fig 5 - Moderns love motion

The ideal toward which all sections of the newspaper should strive is that of more interest through more action. The success of the so-called movie strip is significant. Many newspapers today run not a single picture of an event, but five or six pictures of the same action, in strip form, taken with a motion-picture camera. Such a strip may show the successive positions of a horse leaping

Photo by John Mills, Jr.

Fig. 6.—Action in the human face is an thrilling as any other kind of motion.

That is why the candid shot is so much more appealing than the study opertrait.

a hurdle in a horse show, a scene in n prize fight, an argument between two legislators. The fact that newspaper readers enjoy sitting down and studying over such a progression of action will illustrate how vital this factor of action really is to the modern mind. If editors fully realized this, they would learn the possible means of ridding their paper of deadly dull, actionless photography.

So urgent is this modern desire for netion that many a skillful photographer has tried to introduce it into his reproduction of a still life. Sent to photograph a new statute in the public square, or the façade of a new building, he has not been satisfied with n direct shot but has so placed his eamera and utilized light and shadow that the subject was dramatized. Usually such dramatization resulted from n mild distortion of form, accentuated hy unusual lighting effect. How this may produce the sense of action is not hard to malyze. The mind detects a fluidity in this figure in distortion, which suggests that it might melt into other shapes and attitudes. Its nightly and permanence are removed. An object is in equilibrium to the human eye when it seems to he satisfying the laws of gravity by a safe and secure halance. Upset this solid halance hy showing it at an angle, and you give it motion in secretainly as if you took in citizen off the sidewalk and halanced him perilously on a tightrope

The cameraman calls such a picture an angle shot (Fig 7) It may be very useful in providing a semblance of action when this is totally lacking, but angle is only pseudo-action. The picture editor should be very careful not to be overseduced by such pictures. A skyscraper viewed from the sidewalk may be amusing, a highthouse snapped from notor as an airplane flew over it may have a most unusual form. It only belongs in the paper if in addition to its manufactured action it has definite news value.

To sum up, n picture is judged for its content on three factors, personality, news, action Experience in handling newsphotos will teach the beginner to recognize these factors automatically in the meantime, he can speed the dawning of his own picture sense by carefully rating each shot for these separate elements

# JUDGING NEWS FEATURE PICTURES

Nows feature photographs (Figs. 12, 13, and 16), whether for the inside pages of the daily, for the Sunday feature pages, the rotogravure, or in fact for the eurrently popular news picture magazines, are more easily selected if the picture editor bears in mind that they are just what the words imply photographs which represent features of the news

News in this respect may mean the last-minute news stories showing on the front page of the paper, or recent news stories which have attracted widespread attention and continue to hold interest for the reader, or long-range news trends that affect a great many people, or finally just the current life of the people as revealed by the camera's eye In one way or another the feature

Photo by John Mills J.
Fig 7 —Angle photography adds action to still 1 fe

A local flower show may be reported in pictures on the day it occurs. On the following Sunday the rotogravite may broaden the pictorial coverage to include companions with photos of flower shows in other cities. Today's pictures of the apple-blossom festival point naturally to a Sunday picture layout of the festival in previous year.

Thus straight news often suggests a feature follow-up

Long-range News Features It has been more than twenty years since the story of a communist Russia first hit the front pages, yet popular interest in the Russian experiment has by no means subsided Photographs which show any phase of life in Russia, in home, factory or farm, still have a definite link to long range news and to popular emotions . They find an interested audience even without any immediate news tie-up. The World War and subsequent international events, the rise of fascism the wars in Ethiopia and Spain and China, have made us conscious of historical trends to which we ourselves belong. We see ourselves in closer relationship to other portions of our planet than we ever did before and we are therefore instinctively interested in pictures of German children bearing arms, of Italian women kissing Mussolini's hand Twenty-five years ago nictures of Germans and Italians at home would have been rather tame travel photos, today they affect us, because they are live features of long-range news

Depression worries made us economics-conscious and New Deal remedies bave kept the subject in the news. Today we are interested in feature pictures which show how people are living at the bottom of the economic scale, in city slums, in mountain shacks, in farm districts where modern comforts are unknown, in the huts of the Southern sharecroppers and in the sordid surroundings of coal mining towns. We likewise have an enormous curiosity about life at the top of the economic scale we like to see the pictures of the country's "most eligible hachelors" worth \$50,000,000 or more, of the wealthiest girls in the world, of the movie stars earning the biggest salaries, of the parties on J. P. Morgan's yacht (if they are obtainable). We are also interested in economic remedies and changes new model housing, migrations of farm population, etc. These feature pictures do not show things with which we are directly familiar, yet they have a vital

appeal to almost everyone, because of their link to long-range news

The picture editor who understands this will not lack for news feature ideas Hundreds of long-range news subjects exist, and every one of them will prove a fertile field for news feature photo ideas

Current Life of the People II long-range newsphotos fail, there is a reservoir of feature picture ideas close at hand, in the every day doings of everyday people. We are interested in our neighbors, whether in kindly fashion or maliciously. We like to see pictures of our children in their classrooms at school, of local matrons tending their gardens, of the animals in the local zoo, of the town's healthest babies, of choir boys in local churches and sweet girl graduates, of well-known businessmen at their Sunday golf game and housewives baking prize competition layer cakes for the state fair. Rushing crowds at the business hour, Christmas shoppers caught in a whirl of snow, traffic policemen in new uniforms—these and ten thousand other feature subjects are at the picture editor's elbow, and they have instant appeal.

Humorous Feature Pictures Nor should he overlook the feature ideas with a humorous slant. There will be many occasions for photographing or selecting photographs of "oddities" in the news. A student mud battle, a dignified banker giving a demonstration of the hula bula in a bathing suit, an intelligent jackass who won a prize over 10,000 mules. One can never predict whore humor may be found, but it is usually a fine feature.

Rating Feature Shots Good feature pictures, then, have a news connection, whether remote or immediate Like straight news shots, they can be judged for personality, news in its broadest sense, and action

Possibly more discrimination should be expected in the selection of feature pictures than of straight news shots. News is insistent, it demands to be known even when horror, tragedy, or sordidness is its accompaniment. If the news is big enough, even good taste will have a hard time suppressing the pictures. Newspapers and the newsreels have shown us the hattered and mangled bodies of slaughtered Chinese, strewn revoltingly or et the streets of Shanghai and other war-torn cities of the Far East. They have shown us survivors of air disasters, clothes burned from their

bodies, running from the flames. The modern mood seems to dictate that there is no escaping from the news, that it is better to face the facts as photography reveals them.

When it comes to features, a greater degree of the element of taste may enter into the selection. It is hard to say that it does, but the further afield we get from day-to-day actualities, the less probable it seems that the public will be ready to enjoy pictures which are crude, yulgar, or otherwise offensive to the eye

### JUDGING NEWSPHOTOS FOR COPY

If the new spaper reader were going to see original photographs, instead of their reproductions on new sprint, the task of judging and selecting would be easier. However, before any news shots can reach the reader, they must be subjected to engraving and printing processes which may enhance or destroy the story they have to tell. The final result will depend largely on the picture editor's skill in selecting the more suitable copy for news engraving purposes. He must therefore be able to judge the photo for copy as well as content.

The engraver will of course do all in his power to modify and adjust his methods to the sort of pictures handed him. He may be so successful that the final result is more attractive than the original, yet he cannot produce good halftones unless he gets copy that is reasonably appropriate to the halftone process.

Newspaper subscribers frequently bring in portraits on dullfinish rough grain paper, which are very handsome in effect for private use, a rough fiber or embossed surface may add beauty, but it will prove a stumbling block to newspaper reproduction. Magazines using a higher grade paper may find the dull finish print makes excellent copy for halftones and with a finer screen will get effects of "texture" from originals with fibrous or embossed finish. With the coarse screen used for newspaper work they are quite unsuitable.

The best photographs from the newspaper engraver's standpoint are those which were taken with a good lens, properly exposed and lighted, and printed on white glossy paper. These are the glossy prints so familiar to all who handle newspaper pictures. They depend for their effects not on artistic surface qualities of the paper on which they are made but on their own tone values, which should range from pure hlack through shades of gray Discolored prints, prints of sepia, and those showing traces of yellow, green, or brown tones, though occasionally they may have to be used are not good copy for halftone engraving Glossy prints dried on a tin to give them a higher luster may produce better results than the ordinary glossy But no amount of gloss will make up for what is essentially poor copy

Photo by John Mills Jr

Fig 8—Good copy shows sharp focus detail and contrast Note that even the texture of the material of his suit is preserved in this halftone of a witness before the U.S. Senate Munitions Investigation

The beginner should practice rating pictures on a new threepoint system for their copy values (Fig. 8) Good copy is that which has (1) sharp focus, (2) good detail, (3) contrast in tones

Sharp focus means clarity of outlines If the side of the subicet's face fades off into the background if the speed of the exposure was not sufficient to prevent movement of the people in the crowd from resulting in a blur, the photograph had better be discarded. Equal in importance to clean cut outline is adequate detail. If this picture of a country house has the detail it should have, it will probably show not only the windows, but the lace curtains in the windows the separate bits of tile that form the roof, the outlines of the hincks, the leaves and branches of the trees that give it

Fig 9—Poor copy shows insufficient detail. Note the blurred features of Spreme Court Justice Black making his first rad a address after his appoint ment. The photo was used despite its defects because of its importance as news.

shade And this photograph of a prominent citizen should show not only the nose and mouth and eyes, but the pupils of the eyes If the eyes are merely a blur of dark tone, the likeness in the paper will be unsatisfactory (Fig. 9)

The reason detail is so important in the newspaper print is that so much of it is going to be lost in engraving. We shall see later how the engraver, in making the halftone cut rephotographs the picture through a screen which breaks its solid surface up into

tiny dots A variety of halftone screens are in use, ranging from those which are ruled with 50 lines to an inch, to those which have as many as 175. The finer the screen used, the more dots result, and therefore the more of the picture's detail is preserved Unfortunately, very fine screens, though excellent for magazine purposes and for reproduction of photographs on a variety of high grade coated papers, are not possible where high-speed presses and newsprint are to be used. Newspapers having a rather inferior paper may be obliged to employ a screen showing 50 lines to an inch, better newsprint permits a 65-line screen and the highest grade newsprint may sometimes allow an 85-line screen. The 65-line screen is in most common use for newspapers, whereas many magazines use 120 or 133 and fine hooks 150 or 175 line screen on the highest grade coated stock.

The lace curtains in the windows of the country house, though they show clearly in the glossy print, will have disappeared from the halftone with a 50 or 65 line screen. This is important to know. Unless the glossy can afford to lose much detail and still be interesting, it should go into the discard. The more detail it shows to begin with, the more it will retain after the screen has got in its work.

A newpaper picture editor may have to apply this judgment of detail, not to an original newsphoto, but to a halftone copy of one It is frequently necessary, in finding pictures for the news or feature pages of the paper, to make use of something already in print, such as an illustration in a book, of which no original photograph can be had. The problem of whether such a picture can he reproduced is often very vexing, yet the solution is fairly simple. If the screen originally used on the picture was a coarse one, it prohably lost so much detail that to rephotograph it through a screen for a new engraving would he apt to destroy it altogether. On the other hand, if the first screen used was extremely fine, if the hook illustration still shows a high degree of clarity of detail, then one may hope to get just as good a newspaper cut from it as from the average news photograph. Such halftone copy should he judged by exactly the same rules as apply to a glossy print and must measure up to approximately the same standards of detail, contrast, and sharpness of outlines. In rescreening such a halftone the engravers will take care to place the screen at an obluque angle, avoiding a concidence of dots

So far we have discussed the first two requisites of good photographic copy for the newspaper sharp focus and detail. The third copy requisite is contrast. In many ways this subject of contrast is one of the most interesting the photographic or the picture editor will have to explore. Better understanding of it will lead to better techniques in taking pictures and to better selections in newsphotos.

We have already seen that a proper range of tones, from pure black through grays to white or near-white is demanded by the engraver who must turn the newsphoto into a metal cut. There is a reason for this. When the glossy print is copied through a halftone screen in the engraver's camera, its surface will be broken up into dots, in a manner which will be more fully described later

Suffice it at this point to explain that the action of the light reflected back through the lens from the light and dark portions of the picture results in a pattern of dots which are equally spaced but which vary in size according to the tone values. It is this difference in the sizes of the halftone dots which will make the printed picture something more than a mass of ink. However, if the original print has insufficient contrast so that it approaches a monotone of gray, it will balk the very process by which it is converted into a halftone cut, and the resulting picture in the newspaper will have very low visibility.

From the engraving standpoint, then, contrast is essential. There are also several other reasons for seeking it, as we shall see First, let us remark that the contrast in any photograph is an effect of the lighting. A kedak snapshot taken in brilliant sunlight may have contrast so sharp that it comes near to distorting resemblances, casting black shadows from hats over the faces of the people who posed. On the other hand a photograph taken in the rain, or an indoor shot without sufficient lighting, may give an allover gray with almost no contrast at all.

As between the too contrasty and the too gray picture, the average person will prefer the former He bus a taste that is conditioned to lighting effects, and if these are properly regulated they will produce in him a strong effect. He feels vaguely that the subject bas been dramatized by light What light has really done for him is to give his picture three dimensions

Man's relation to the outside world is not that of a fly crawling on a flat window pane. The world he lives in bas depth as well as

length and breadth In order to see this depth he has stereoscopic vision If a man had but one eye in the middle of his forehead he would look out on a flat-appearing universe. But the images obtained by his two eyes are synchronized into a mental picture which has the third dimension. Since our mental pictures have a third dimension, it is natural we should like to have this quality in the pictures the camera takes for us

Long before the camera existed, this subject of dimension was one of grave importance to painters. The earliest painters including the Orientals, presented their subject in two dimensional representation Gradually, however, lighting effects crept into the picture, to give the illusion of depth With a skillful use of colors, the painter imitated the sunlight and shadows which hy producing tone contrasts, helped the eye to visualize depth, or Just as the figures in a has relief are "modeled" for the eye's image by the light falling on them, so the painter raises his figures out of the canvas by the contrasts of light and darkness he paints into them The painter can do this better than the camera can, because he has the whole color scale to draw upon for contrasts, whereas the camera has but a sensitivity to degrees of light, resulting in a short range of gravs, shading into black We are not referring here, of course, to color photography, which opens up a new set of possibilities in this field

In this restricted medium, the photographer, whether working by daylight or in the studio under artificial illumination, seeks to give his picture a reasonable three-dimensional quality. If he pushes this effort too far he may get the crude hlack shadows and distortions of the amateur snapshot. His skill in lighting the picture properly will determine whether or not he succeeds in producing a photo which has clarity, detail, and as much depth or dimension as is possible without sacrificing other factors.

The picture editor will have an eye trained to appreciate these qualities. In addition to watching his newsphotos for sharp focus and detail he will learn to know what is the right amount of modeling in a picture and will not be ensnared on the one hand hy trick and evaggerated lighting effects, nor on the other hy "rainy-day" photographs which have neither high lights nor shadows.

His standard for judging contrast is simple. The purpose of a photograph is to show the subject to best advantage, whether it be

a person, a group of persons, or a still life Lighting effects may be heightened for purposes of dramatizing this subject, but if the procedure is carried too far, the attention will be drawn away from the subject to the trick lighting itself, defeating the purpose for which the picture was made

On the other hand, if the lighting was insufficient or so badly managed that the photographic print shows an allover gray, the subject will not stand out in three dimensions. Since two-dimensional pictures fail in emotional appeal, such a photo will not be apt to get its story across to the newspaper reader. The term usually applied to such photos is that they are "too flat". That expression is precise they lack the third dimension.

To sum up the newsphoto is rated as good copy if it has the qualities which will best reproduce in halftone, in the coarser screens used by newspapers. It should have clear-cut images and plenty of detail to resist the loss it will suffer as a result of screening and should abow a good range of tones and contrast, both because these are necessary to the halftone process and because they better reveal the subject.

#### A ADAPTATION EXERCISES

1 Select a picture page (devoted exclusively to pictures) from a daily paper published within the last month in a city of not more than 25 000 population. Judge each picture for its news value give it a grade in accordance with the scoring method explained in this chapter, and mark the score in ink on each picture. Be prepared to defend your scoring in class.

2 Select a picture page from a metropolitan paper published in a city with a population of at least 300 600 Score each picture as for Exercise 1

3 Total the scores on the page having the smaller number of pictures Mark this score at the top of the page. Now total the same number of pictures from the other page, selecting the highest scores. Mark this score at the top. Using very specific points of reader appeal write an explanation, between 300 and 250 words in length, of why you consider one page as a whole to possess more intense and wider reader interest than any other page.

4 Using very specific points, write an explanation, between 200 and 250 words in length, of why you consider the highest scored picture on one page to be a better news picture than the highest accred picture on another

page

5 Clip all the front page pictures from a metropolitan newspaper and mount them on a sufficiently large sheet of paper to permit scoring Score each picture for each of the three elements of news value (a) personality (b) news content (c) action Be prepared to justify your scoring

- 6 Suppose a wealthy resident of the town in which you live sends to the town's daily newspaper, unsolicited, a good reproducible photograph of an oll painting which hangs in his home. Assume that you are picture editor of that paper. The painting is an original by Gay depicting a derelict at sea. It was painted about sixty years ago and was brought to your town two years ago hy the present owner, who refused at the time to allow a pint to be made of it. It cost \$5000. Many people have seen it and your paper printed the story about it two years ago. Score this picture on the usual three counts and explain what you would do with it.
- 7 Assume you are a news photographer assigned to photograph a killer being locked in the city nal. He was a former local juster, who, disgrantled, killed the chief of police two months ago and is now being returned for trail after capture in Los Angeles. Would you photograph this man from the back as he passed through the cell door? If you could to a reasonable extent pose the picture, explain how you would do it and what specific effect you would try to get. Would you try to talk the former and present juster into esting a mock sentile at the door for action?
- 8 Suppose two motorcars crash an Sunday afternoon in the crowded principal part of a city 500 miles from the town in which your paper is published. No one is killed, but the chairman of the park board in one car enffers a broken leg, the other car is owned by the mayor, who escapee injury. A free-lance photographer sends your paper a good print of the damaged cars after the crowd has left but with half a dozen persons looking on and, two men trying to lift the cars apart. Rate this picture for your paper.
- 9 A motorear owned by an obscure clerk crashee into a center-of the-street etop light where your town's principal boulevard intersects the principal business street half a block from the post office. No one is injured, though the light on the stop sign is broken and the ear telescopes. A free-lance photographer gets you a good print of the wreek against the stop sign with one person looking on. Rate this picture for your paper.
- 10 Number each story on the front page of a recent issue of one of the local newspapers in your state On copy paper, using corresponding numbers, explain heigh why each story is news with respect to each of as many of the elemental themes as you believe are involved—survival, sex, ambition, escape
- 11 From the same copy of the same paper, select what you consider the most widely interesting local news story which does not have a picture to help report it but which you believe could have been reported by a news photographer had one heen assigned as soon as it was reasonable to expect a tip of the story to have heen reported to the city room. Assume that you were the photographer. Describe the picture you would have tirted to get '12 Rate the picture which you described for Exercise 1.
- 12 Rate the picture which you described for Exercise 11
   13 A press association picture of river flood scenes, after the first spot
- now shots had been published, showed four Negro presones in a chain gang carrying sacks of sand on their shoulders to reinforce the levee. They are dressed in worn prison denim, chains show at their feet. Faces of three are ludden by the sacks, but one has his face toward the camers, a carefree

laugh, flashing white teeth Assume that you as picture editor received this pint for a paper some 200 miles from any flood area, but while flood news is still appearing in your paper Rate the picture for personality, news, and action, explaining your reasons for each score

#### B CHAPTER-ORGANIZING QUESTIONS

- 1 What would be the probable effect on readers if news pictures were published just because they were pietners, without careful regard for their news value but in order to 'get as many cuts in the paper as possible''s (Something of this sort occurred in the early months of 1935, when were pictures were new and some editors used a large amount of space for pictures whose one qualification was that the underline could note "transmission by wire' For a limited time, of course, interest did lie in the mere fact of scentific immovation')
- 2 For what hesides personality, news, and action must an editor judge news prints?
- 3 What does the engraver's screen do to the continuous tones, or solid surface of the print?
  - 4 What is meant by a 50-line screen?
- 5 Explain why some magazines can use 133-line screen halftones when newspapers can seldom use a screen of more than 65 lines
- 6 What effect does the screen in photoengrsving have on the degree of detail in a photograph?
- 7 Why is a glossy print or "squeegee" preferable for newspaper purposes to the more artistic, softer surface qualities of pictures which are to be used for mounting?
- 8 What three-point system should be followed in judging news pictures for copy value?
- 9 What is lacking, from the picture editor's standpoint, if the side of a person's face in a news picture fades off into the background? If this fading is markedly present, or if insufficient speed of exposure has allowed slight movement in the picture?
- 10 Explain what simple criterion may be used for judging whether delail is adequate in a picture which shows an occupied brick house, a man or woman in street dress, a picture in which a tree affords shade or the close-up front view of a face
- 11 If an original photograph is not available, but a halftone reproduction on glazed paper is available, can a satisfactory reproduction be made? If so, what points in the halftone should be examined?
- 12 What part do halftone dots play in the final printing process of the newspaper?
- 13 What quality in a newsphoto print determines the clarity or visibility of the picture as it finally appears in the newspaper?
- 14 In Shakespeare's only allusion to perspective in painting he calls it "best painter's art?" What is the principal way in which painters obtain the effect of perspective on canvas? What concern must the news photographer have to give the objects in his pictures a lifelike illusion of depth?

- 15 What characteristic of our eyesight makes us prefer pictures that are dramatized by light?
- dramatized by light?

  16 What objectionable effect might result from taking a picture in very brilliant similarly?
- 17 Explain how exaggerated lighting effects may defeat the purpose of a news picture
- 18 Select two pictures from a newspaper which appear to have been made from prints which were rated as good copy for reproduction with the coarser screen used by newspapers Be prepared to point out evidence of clear-cut images, adequate detail, range of tones and contrast
- 19 Select from a newspaper a picture which appears to have been made from a print which was not such good copy as those from which the pictures selected for Exercise 18 were made Be prepared to point out defects in detail, contrast, or focus

#### CHAPTER IV

# ELEMENTS OF PHOTOGRAPHY AND COLOR PHOTOGRAPHY

# PREVIEW QUERIES

Why is the image reflected on a film in a camera upside down?
What determines the apeed of a camera lens?

What is meant by sn f/5 6 designation for a lens? If you know the exposure required for an f/2 lens, how would you figure the exposure required for an f/11 3 lens?

What is the difference between "color-blind" films, orthochromatic films, and panchromatic films? If you have a panchromatic film which is oversensitive to red, what can you do to get correct color values?

Why are negatives often developed less fully than printing papers? In it better to attempt to alter contrast in a print by short development, to change to a different contrast of paper, or to vary the composition of the developer?

What is the difference between the additive process of obtaining a color photograph on a screen and the subtractive process of obtaining a color photograph on paper?

I N order to discuss news cameras intelligently, we should have an understanding of just what a camera is—what any camera is and how it works.

Let's make a simple experiment Open the shutter and the hack of an old box camera (the Brownie) and hold a translucent bread wrapper against the opened back. Now point the front of the camera toward the window, and on the paraffined paper you will see an image of the window, upside down and in full color It is that same image which would be permanently recorded in black and white if a roll of film bad been exposed in the back of the camera where the paraffined paper was placed. Of course the camera, when film is in it, is shut and dark, otherwise light other than that of the image would record on the film strongly enough to obliterate completely the dum image.

So a Browne is a camera! So also would be a cigar box with a needle hole stuck in it, and a good camera too, for certain work. A completely darkened room in which there was a white wall opposite one tiny hole at the other end would also be a camera, in the dictionary sense, an upside-down image of the outside scene would appear faintly upon the white wall. The camera we use today is nothing more than a practical application of this ability of a minute aperture to project an image. Captured with film the image becomes a permanent record.

In the process of adapting our lightlight room—this was known as a "camera obscura"—to the function of a recording instrument, many mechanical features were introduced. Lenses were substituted for a pinhole, this particular improvement occurring even hefore film was invented, shutters were devised, and the cigar-hox effect gave way to hellows or collapsible thies. The most complex aerial camera performs its function fundamentally in the same way as the Brownie, or the cigar hox, or camera obscura. A lens mounted in a lightlight chamber projects an image a short distance away onto a surface supplied with a layer of film, or light-sensitive emulsion.

# ESSENTIALS OF THE CAMERA

A shutter allows light to be admitted for any desired duration of time. A disphragm, or some simple mechanical device, also serves to control the amount of light entering not in units of time, but in quantity, exactly after the fashion of the iris of the eye, which contracts in a hight light and widens to admit more light in the dark

The lens, shutter, diaphragm, and film are the working essentials of the camera. We use a lens instead of a pinhole because it can be constructed to admit more light than a pinhole. As the tiny hole in the wall of our camera obscura is widened the image on the wall becomes fuzzier until it is no longer recognizable as an image. A lens can be increased in area, allowing more light to enter, and still give a sharp image of the same size. The lens collects a sufficient amount of light, by virtue of its relatively large area, to allow spit-second exposures on our film. Seldom would enough light reach the film through a pinhole to permit exposures of less than a second, even with the most sensitive films in the hrightest sunshine.

#### THE LEVS

Lamitations of the Lens Now while it is obvious that the advantages of the lens entirely preclude the use of a pinhole in photography today, the lens nevertheless has various inherent physical limitations which we must respect in order to make it series is

Most of us have used a common magnifying glass to concentrate the sun's rays onto a piece of cloth with sufficient intensity to ignite it. Perhaps we have held this same glass between an electric light hulb and a piece of paper and seen an image of the lamp on the white surface. If the glass was moved toward or away from the light source, the sharp image hlurred and lost its definition with a movement of the lens of a fraction of an inch

This magnifying glass is the lens of our camera. On the cheaper hox cameras the lens is a single piece of glass, as is the magnifying glass. On more expensive cameras several layers of different glass may be cemented together or mounted in combination slightly separated to form a single unit acting like the simple lens hut able to perform its optical function more efficiently.

One prime limitation, then, of our lens is that in order to obtain a sharp image with it—or any image at all—a given lens must be placed a certain distance away from the film surface. Not only must a certain separation exist, but, as the object whose image we seek is nearer to or further from the lens, the film in turn must be correspondingly further from or nearer to the lens.

If the lamp bulh of our illustration were moved closer to the magnifying glass, it would be found that in order to get a sharp image the sheet of paper would have to he moved further away from the lens. For each change in the distance between the object and the lens, there must be a change also in the distance between the lens and the image plane—the place where the film is—in order to effect a sharp image of the object.

If the object is distant enough from the lens so that the light rays emanating from it are parallel—the sun's rays, for example, or those from any object several hundred feet off—then the distance behind the lens at which these parallel rays are brought to a sharply focused image is known as the focal length of the lens, or its focus. A 6-in lens would focus distant objects sharply at a

point 6 in back of an optical point or plane, in the lens A 12-in lens would give on a film, twice the linear size of the film used with the 6-in lens, an image showing the same amount of subject twice as large. The longer the focus of the lens, the larger the image size, in other words, the size of the image is directly proportional to the focal length. Hence, we use proportionally longer focus lenses on a given camera when we want a larger image. Small, distant objects then can fill up the plate to the edges.

There is another reason for using long-focus lenses. This involves the subject of perspective. In reality, perspective varies only with the distance of the lens from the subject and has nothing whatever to do with the relative focal length of the lens. In portraiture, the long-focus lens is a means of getting a large image of the sitter, not directly a means of avoiding perspective distortion—the oversize effect the camera seems to give liands or knees lying closer to the camera than the sitter's head.

If we fill up the ground glass with the image of the sitter, using a long-focus lens at a 15-ft distance, we probably will notice little or no so-called distortion. The long lens enables us to get our large image from the greater distance, and it is the greater distance, not the long lens, which gives us the so-called distortion-less perspective. If our eyes were trained to see things exactly as they are and not as we think them to be, we would notice this change in perspective as we approached or withdrew from a subject. A tall building viewed at short range leans backward just as much for our eye as for the camera lens, and if we look at it carefully we can see that it does, that our brain, not our eye, struchtens it out.

The focusing problem is not encountered with the pinhole. All objects near and far will appear about equally sharp whether the pinhole is very close to the film or some distance away (within limits, of course). This is decidedly not true of the lens.

Depth of Focus We use the term depth of focus in connection with this relative mability of the lens to bring to a sharp focus objects not all in the same plane. The pinhole aperture has an almost infinite depth of focus. As the inst diaphragm of the lens is made smaller—"stopped down"—in other words, as the effective size of the lens approaches pinhole size, objects both nearer

It is expedient to have a standard measure of speed so that we may compare directly the speeds of lenses whose focal lengths are Suppose our lens of 6-in focal length has a diameter of 1 m Then this ratio, 1 6, becomes a pure number which may he compared with other similar ratios Thus, a 12 in lens with a diameter of 2 in would give a ratio of 2 12, which equals 1 6, and we could then say that the lenses were of the same speed makes no difference what the units of measurement are, whether millimeters or inches, provided each lens's measurements are made by the same units

In measuring the lenses, the ratio is written as a fraction with the numerator reduced to one so that it may be dropped and the simpler numbers remaining as denominators may be compared directly In this case we would say that both these lenses have a speed of 6 This is usually written f 6 or f/6 A lens of 8 in focal length and an aperture diameter of 1 in would then have a speed of f/8, as also would a lens of 16 in focus and a 2 in aperture, or one of 4 in focus and 36 in diameter

Our lens is frequently stopped down in practice to achieve greater depth of focus Ohymusly the speed is then decreased The ins diaphragms on lenses are marked with an f number in such a way that the photographer knows exactly how much his speed is decreased in terms of exposure A series of f numbers appear on the lens harrel, each one indicating a proportionately greater amount of exposure required to admit the same total amount of light as the opening becomes smaller

This series of f numbers is derived in this fashion The amount of light admitted by the lens is directly proportional to the area of the lens The area of the lens is proportional to the square of the diameter, and therefore the speed of the lens is proportional to the square of the diameter-except that to be precise we should found to have an f value of 8 with one of f/11, we would square each figure, giving 64 and 121 respectively This is practically a ratio of 1 2 We therefore say that the f/11 lens is two times as slow as the f/8 lens, or, because our speed is in inverse ratio to slowness, that the f/11 lens has one-half the speed of the f/8 lens With this fact before us, we would know that to give a correct exposure to a film using an f/11 lens, we should have to give twice as much time as we would for the f/8 lens

It is expedient to have a standard measure of speed so that we may compare directly the speeds of lenses whose focal lengths are different Suppose our lens of 6-in focal length has a diameter of 1 in. Then this ratio, 1 6, becomes a pure number which may he compared with other similar ratios. Thus, a 12 in lens with a diameter of 2 in would give a ratio of 2 12, which equals 1 6, and we could then say that the lenses were of the same speed. It makes no difference what the units of measurement are, whether millimeters or inches, provided each lens's measurements are made by the same units.

In measuring the lenses, the ratio is written as a fraction with the numerator reduced to one so that it may be dropped and the simpler numbers remaining as denominators may be compared directly. In this case we would say that both these lenses have a speed of 6. This is usually written f.6 or f/6. A lens of 8 in focal length and an aperture diameter of 1 in would then have a speed of f/8, as also would a lens of 16 in focus and a 2-in aperture, or one of 4 in focus and 15-in diameter.

Our lens is frequently stopped down in practice to achieve greater depth of focus Obviously the speed is then decreased

amount of light as the opening becomes smaller

This series of f numbers is derived in this fashion. The amount of light admitted by the lens is directly proportional to the area of the lens is proportional to the square of the diameter, and therefore the speed of the lens is proportional to the square of the diameter—except that to be precise we should say the slowness of the lens. If we maked to compare a lens found to have an f value of 8 with one of f/11, we would square each figure, giving 64 and 121 respectively. This is practically a ratio of 1.2. We therefore say that the f/11 lens is two times as slow as the f/8 lens, or, because our speed is in inverse ratio to slowness, that the f/11 lens has one-half the speed of the f/8 lens. With this fact before us, we would know that to give a correct exposure to a film using an f/11 lens, we should have to give twice as much time as we would for the f/8 lens.

It is expedient to have a standard measure of speed so that we may compare directly the speeds of lenses whose focal lengths are different Suppose our lens of 6-in focal length has a dameter of 1 in Then this ratio 1 6, becomes a pure number which may be compared with other similar ratios Thus, a 12-in lens with a diameter of 2 in would give a ratio of 2 12, which equals 1 6, and we could then say that the lenses were of the same speed. It makes no difference what the units of measurement are, whether millimeters or inches, provided each lens's measurements are made by the same units.

In measuring the lenses, the ratio is written as a fraction with the numerator reduced to one so that it may be dropped and the simpler numbers remaining as denominators may be compared directly. In this case we would say that both these lenses have a speed of 6. This is usually written f.6 or f/6. A lens of 8 in focal length and an aperture diameter of 1 in would then have a speed of f/8, as also would a lens of 16 in focus and a 2 in aperture, or one of 4 in focus and ½ in diameter.

Our lens is frequently stopped down in practice to achieve greater depth of focus. Obviously the speed is then decreased The ins diaphragms on lenses are marked with an f number in such a way that the photographer knows exactly how much his speed is decreased in terms of exposure. A sense of f numbers appear on the lens burrel, each one indicating a proportionately greater amount of exposure required to admit the same total amount of light as the opening becomes smaller.

This series of f numbers is derived in this fashion. The amount of light admitted by the lens is directly proportional to the area of the lens. The area of the lens is proportional to the square of the diameter, and therefore the speed of the lens is proportional to the square of the diameter—except that to be precise we should say the slowness of the lens. If we wished to compare a lens found to have an f value of 8 with one of fflit, we would square each figure, giving 64 and 121 respectively. This is practically a ratio of 1.2. We therefore say that the f/11 lens is two times as slow as the f/8 lens, or, because our speed is in inverse ratio to slowness, that the f/11 lens has one-half the speed of the f/8 lens. With this fact hefore us, we would know that to give a correct exposure to a film using an f/11 lens we should have to give twee as much time as we would for the f/8 lens.

The senes of f numbers marked on all lenses is universally standardized so that each succeeding larger number represents a decrease in area of one-half the preceding size. This gives us an instantaneous clue to the change required in exposure when moving from one stop to another, or to another lens. The senes used by Britsh and American manufacturers runs.

f/2 28 4 56 8 113 16 226 32 45 64

The f/11 of our illustration (f/11 3 more accurately) then requires twice the exposure of an opening of f/8, f/16 requires twice the exposure of the f/11 3 opening, etc. An f/16 opening would require four times the exposure of an f/8 opening, since the square of 8 is 64 the square of 16 is 256, and 256 is four times 64. Most Continental cameras use a similar system except that the points calibrated happen to be about midway between those on the British and American system, running f/6 3, f/9, f/12 7, f/18, etc. But each succeeding number in each system indicates an aperture of half the area of the preceding one and a consequent increase of twice the exposure for each calibrated stop

The largest aperture of many lenses does not happen to fall on one of the calibrated points, lenses of speed f/3.5 or f/4.5, for example To compare the speed of such a lens with our known stop system, we merely square the f value and compare it with the nearest stop mark on the system Thuy, f/3.5 squared becomes 12.1 Compared with f/4 we get a ratio of about 12.16 or 3.4 It would then he necessary to give only three quarters the exposure with this lens wide open as with one set at f/4, or, out the other way, an f/4 lens would be four-thirds slower than an f/3.5 one and so would require four-thirds, 11/4 times, more exposure, which is one-third more

Working similarly we find that an f/1 5 lens is not quite twice as fast as an f/2, although f/2 is the next smaller stop marked on the f/1 5 lens but is actually only one and four-fifths as fast (This, in practice, is a difference too small to concern us). The largest opening on a given lens, then, is not necessarily exactly twice as fast as the next stop opening—although of course this is true for the other marks—but only indicates the relative maximum aperture of that specific lens

The difficulties inherent in lens making increase tremendously as lenses are made faster or larger, for lenses, even the best ones, are a compromise with physical stumbling blocks all along the line. No lens will bring high rays of the different colors of the spectrum to a focus at the same plane without a good measure of coercion, and then this is accomplished only partially. As we increase the focal length of the lens this problem becomes more acute, since the absence of a common focus becomes more apparent to the eye and the different colors are coming to varying focuses further and further apart.

Other problems heset the lens designer Chromatic aberration is but one of a nestful A photographic lens cut from one lump of glass has curved—spherical—surfaces Light rays coming from the edge of such a lens do not come to a focus on exactly the same plane as do the center rays, this of course tends to hlur over the sharp image formed by the center of the lens with an unsharp on formed from the marginal rays and is called spherical aberration. Both these faults may be corrected by the addition of a compensating lens to our original lens. The compensating lens is not a convex one like the magnifying glass hut is here a concave lens which counteracts the two faults

Astignatism in Lenses One of the most serious faults and most difficult to correct is astignatism. It becomes a more serious factor as lens speed is increased. It is the same defect which we know as astignatism in the human ever

Astigmatism affects only those light rays which enter the lens at an angle, or obliquely — The oblique rays do not come to focus at a point but as two separate lines, as an illustration, the image of a minute cross could never be entirely sharp — Either leg could be brought to focus but always at the expense of the other, which would remain hlurred — With very fast lenses, where most of the rays enter obliquely, astimatism hecomes a serious drawback

Today most lenses are "astigmats"—corrected for astigmatism. The first to be so corrected was the famous "Protar," by the addition of a new glass called "haruum crown" to the lens. That was in 1890, and from that time on the construction of fast, well-corrected lenses became practicable.

## THE FILM

Having projected an image through the lens, we must look at the substance upon which the image is recorded, the film (Γig. 8) light is shined through the negative onto the paper positive. The positive will then he darkened by development just as the negative was; but this time our image will have the correct values. The opaque portions of the negative, which were the hright parts of our original image, will prevent light from reaching the paper emulsion in those areas and we shall get the white of the paper corresponding to the whites of our image. The trans-

Photo by Harold Rhodenbaugh

Fig. 10—The news photographer examines the negative of the photo he made at a fire. In this negative, black areas of the subject are shown as white or translucent, white areas as black or opaque

parent portions of the negative, which were the dark parts of the original image, will pass hight through to the paper, allowing it to develop up toward black in those areas. Thus we have made a photograph.

The Importance of the Developer. We never could have accomplished this were it not for certain unique properties of the silver bromide emulsion and the developer used on it. A photographic developer, in chemical parlance, is a reducer. This means in

spectrum However, even dye-treated film remains more sen sitive to the blues and violets than to the rest of the colors. This runs counter to color sensations as they affect the human eye Yellow appears hrighter or lighter than any of the other colors, and, as we look toward the two ends of the spectrum, the colors grow darker

Having made the film sensitive to all colors, it is now necessary to cut down its sensitivity to the blue end of the spectrum by some other means, provided we want correct color rendition in monochrome. If we do cut down the sensitivity of the film in any portion of the spectrum, by whatever means we sacrifice speed

## PHOTOGRAPHIC TILTERS

Photographic filters are glass or gelatin disks dyed to transmit or absorb any desired colors. We use them in front of the lens, ordinarily to restrain the violet light, or sometimes to make use of only certain colors in the taking of the picture. The commonest filters appear to the eye as pale yellow, greenish, or dark amber yellow. These transmit most light except ultraviolet and some of the blue, thus counteracting the innate tendency of the film to greatest sensitivity to blue and violet. Since the filters absorb some light, exposure must be increased to compensate

In recent years, panchromatic emulsions have been developed which are oversensitive to red rays. These films are very fast in artificial light hecause ordinary electric lights emit a high per centage of red and yellow light. To gain correct color values with such a film—if we can afford to sacrifice some of its extreme speed—we must use a filter which will absorb some of the red as well as the hluc rays. A green filter does this. It looks green, but of course it is not a pure green, for then all colors except green would photograph black.

Manufacturers of hoth films and filters issue tables telling just how great an increase in exposure is required with a given film and filter combination and under various light sources. Not all combinations work, of course. For example, a red filter used on a color blind film would evelude all but red light and therefore render that particular film useless, whereas a red filter used on a highly red sensitive panebromatic film in a room illuminated with a reddish light would cause almost no increase in exposure.

# FILM EXPOSURE AND DEVELOPMENT

So far, we have said practically nothing about exposure or about developing the film. Most of this will be discussed under technique. Here we shall touch on the theory of these subjects just sufficiently to give a background for understanding the practical information.

First we may mention the problem of exposure Obviously, for any given lighting conditions and for any particular film there is a single theoretically correct exposure which the film should receive to order to present a faithful record of the tope values of the subject. If we give too great an exposure to light the entire film will be reduced to metallic silver and the variations from unexposed area to fully exposed area which constitute the image will have been lost. With too little exposure either no image will appear or ao image will be produced in which only the high lights of the subject have registered oo the film.

Most film has a wide exposure latitude Io other words it will still give a printable image even though the exposure is varied within wide limits Suppose we have a known correct exposure of one second Ordinarily we could expose this same film as little as 1/0 sec or as much as 10 sec and still obtain a recognizable impression of the subject

That means a workable range in the neighborhood of 1 100 which is pretty wide! Just because the range is wide we have no excuse for failing to ascertain the exposure as accurately as conditions will permit in each circumstance. The underexposed negative gives a distorted rendering of the values in the subject, brightly illuminated portions of the subject will stand out while darker portions will be too dark and lack detail. With over exposure, the values of the subject become compressed into a shorter scale of values until the compression reaches a point where all values are so overexposed that there is little visible difference between them.

This idea of the variation in the density of the film with a variation in exposure may be plotted on a graph in what is known to photographers as the characteristic curie

Suppose that oo our graph paper equal spaces represent constantly doubled exposures Thus the first space oo the graph stands for an exposure of 1 section the next space 2 sec, the next space 3 section 1 secti

4 see, and so on, 8, 16, 32, 64 sec This corresponds to practice in exposing negatives, so we must remember that the equal spaces on the graph mean a doubhag in exposure, and not just a simple arithmetical progression. 1, 2, 3, 4, 5, 6, etc.

On the graph paper we now draw a curve which stands for the increasing density of the film as the exposure time is doubled and then doubled again and yet again. Starting at the lower left-hand corner of the graph, we place a dot indicating the density of the film at the end of 1 see, then a dot a little higher indicating the density after 2 see, etc. When these dots are all joined together they will look somewhat like an elongated S, with the lower left portion of the curve at the beginning rising rather steeply, then moving upward for a space in almost a straight line and then curved again at the upper right. The lower left curve represents underexposures of the negative, and the upper right curve overexposures. Correct exposure has somewhere in the middle or straight-line portion of the S, where film density is increasing evenly with increasing exposure.

Imagine this curve as formed by increasing layers of silver deposit for cach doubling of the exposure, and the reason for correct exposuro becomes clein. In the first part of our curve, that is, in the thinly exposed portion of the negative, where the silver deposit is very small, it is seen that the density is increasing at a rate faster than the exposure. Each time we double the exposure, the density added is greater than the previous time. A bright portion of an image would be proportionately denser on the negative than it really should be. Hence in the final print this bright portion would be represented by an area brighter in proportion to the rest of the print than it was in the original subject. Thus, by underexposure the values are stretched out and the brighter they are in the image (or the denser on the negative) the more out of proportion to other values or tones they will appear.

The middle section of the characteristic curve is a straight line Density of the film is increasing evenly with increases in exposure Each time the exposure is doubled, a new layer of density is added, and each layer added is exactly the same thickness as the previous one. This is as it should be for correct value reproduction. Under these conditions an area in the image which is twice as bright as another area will expose the film twice as much and will

produce a corresponding increase in density in the film. This will result in a range of values exactly equal to those in the image. We have just seen that this would not have been the case with an underexposure.

When we get to the top of the characteristic curve and are working with overexposures, we find that density is increasing less than it should in proportion to the exposure. The curve flattens out, indicating this. With overlong exposures the values are compressed, the darker tones of the image continue to create further density to the negative, while the brightest tones of the image tend to slow up their action on the film.

The theoretically correct exposure then lies in this straight-line portion of the characteristic curve. In actual practice this is seldom exactly achieved-particularly under news gathering cooditions Nor is it always desired A variation from the ideal exposure of from two to four times will not ordinarily seriously distort the values, although of course the exact amount of varia tion given a particular film depends on the range of values in the subject. If the values extend over a range as great as the straight-line portion of the curve, then there is but one really correct exposure If the values are less than that range, there may be several exposures equally correct. If the values are much longer than the straight line portion then it is obvious that some portion of the subject will not be reproduced with theoretical correctness Occasionally—as will be discussed later—we deliberately alter the exposure because of some peculiarity in the subject or because of a desire to obtain a specific effect by distortioo The fast modern panchromatic emulsions gain some of their speed by having a very long "foot," or first section of the curve, which is intended to be used when speed is required. The distortion is far from scrious-the foot practically has a straightline section of its own-in fact, often a slight underexposure gives more pleasing tone values

When we strive for a perfect negative, we must remember that our end product is seldom a negative or even a positive trans-

<sup>1</sup> Much greater exposures cause the phenomenon of reversal of the image, that is we find ourselves not with a negative but with an extremely dense positive image. This peculiarity enables manufacturers to make 'direct positive' films for producing copies without any intervening negatives Exposures are necessarily many times greater than those for obtaining regular negatives.

pareocy, but is a sheet of coated paper (with the real eod product heig in the case of the newspaper, a screen engraving). A long hightness range, that is a long scale of values from light to dark must be compressed if it is to be fitted onto a sheet of paper or else some of the values at one or both ends of the scale must be sacrificed

A transparency viewed through a bright light can faithfully reproduce, value for value the hightness range of most subjects. However, on a sheet of paper the hightest high light, instead of heing an actual light, can he shown only as hright as the paper is white and the hlackets black is no blacker than the blackness of the silver particles on the paper.

We may state these brightness-range concepts in round numbers. A fast panchromatic negative can faithfully reproduce a hrightness range of alout 1 250. It can reproduce with an acceptable degree of distortion a brightness range two or three times greater. In other words, if the darkest shadow area in a landscape reflects a light of unit otensity, and the hrightest high lighted area is ahout 250 times as hright, then we could exactly duplicate this range on our negative. We could also reproduce it on a positive transparency, we could not reproduce this full scale on a printing paper, for the printing paper range will not rue more than ahout 1 25, or 1 80 at the best. The consequent result is the compression of the values and, except for commercial subjects where infinite detail is important, some of the values will be scarficed in either the shadow end or the high light end if we produce a print with any degree of brilliance.

Manufacturers do not offer much quantitative information about their films. They merely state that such and such a grade of film is for a particular purpose. The fast panchromatic emulsions generally have the longest range. Process film has the shortest, for a very small difference in value in the subject will make a marked difference on the film. It is used primarily for copying printed matter and line drawings. To between these two films are others giving varying degrees of contrast and supplied in various degrees of color sensitivity.

With the aid of a good photoelectric-cell exposure meter, it is possible to make actual readings of the light intensities of most subjects. The high lights and shadows of a studio subject may be quickly checked to see if they fit within the known range of the

film emulsion Exposure meters of any sort are not much use to the news photographer There are several reasons for this, the first and most obvious heing that he seldom has time enough during assignments to fuss with the instrument, the picture may be gone and all he will have for the editor and his own trouble is an exposure reading of a scene already marched on with time! Another reason is that the flash hulh used so frequently is an unitarying light source which could not be read by an exposure meter anyhow. The man who is photographing picture after picture day after day and always seeing his negatives developed just does not need an exposure meter. He might if film latitude were not what it is or if his end result had to have perfect quality for presentation as an enlargement.

The newspaper which maintains a studio and does still life or advertisers' photographs or architectural work might investigate the possibilities of an exposure meter. Of course a photoelectric cell meter is a sine qua non for natural color photography, than which nothing is more exacting

Theory of Development We must now touch upon the theory of development Some of the developing agents most used are metel (also known as Elon), hydroquinone, pyro, glycine, parapheny lenediamine The first two are most common around the news plant Pyro may be used by those who wish something a little different or who are accustomed to it. The last two are used chiefly for special fine-grain developing.

Most developers cannot develop the film effectively in water alone. Other chemicals are added to assist the developing agents. To one thing being chemical reducers, they oxidize rapidly. A preseriative is added to impede the too rapid disintegration of the developer. Sodium sulphite is universally employed for this purpose.

An accelerator serves the purpose its name implies, most of the developing agents will develop very slowly if an alkali is not added to the solution Sodium carbonate is the customary alkali although maximum-energy developers may use a stronger one

A solution of these chemicals with the agent constitutes the developer, usually known as "soup" to the newspaper man Sometimes there is another chemical added, a restrainer This does several things, it slows up the developing process at the start, it prevents "fog" and on prints it has the same effect upon

the "color" of the black of the silver salt and allegedly produces clearer high lights and better shadow detail Potassium hromide is the restrainer

"Fog" is the term used to describe deposits of metallic silver on the film which are foreign in the image. It may be a thin deposit of silver all over the image, or it may lie only in certain areas. It can be caused by light, by static electricity, or by chemical means. Potassium bromide for some reason has a more pronounced restraining action on chemical fog than upon the image. Therefore it is used to keep negatives and prints free from the grayed effect of some chemical fogs.

The developing solution reduces the exposed silver salts to metallic silver, it has no effect upon the unexposed salts, who remain light-sensitive Consequently, the film, after rinsing is placed in another bath whose function is to remove all the unexposed silver bromide, leaving a transparent film support with only the solid silver of the image remaining in the gelatin

This process is called fixing and is done by sodium thiosulphate, commonly known as hypo Nothing further remains to be done to the film except thoroughly washing away the hypo and drying the gelatin. We may now make as many prints from the negative as are desired Printing papers are manipulated very much like film.

We have seen how a change in the exposure can alter the relative values of the image. Variations in exposure can distort the black and white rendition of the subject. It is prevalent error that we can also distort the relation of the values of the subject hy changes in the method or time of development. This is emphatically not possible. Changes in the developer or in the time of development do alter the contrast of the negative, but not the relation between the tones.

This requires some explanation. We saw how an underexposure of the negative makes high lights proportionately brighter than shadows. If development is prolonged, the high lights will grow denser, up to a certain limit, but the shadow portions will also grow denser, and proportionately with the high lights. We can change the over-all contrast of our negatives, then, by longer or shorter development.

<sup>1</sup>Gamma is a term used to measure contrast of negatives, having significance only when dealing with correct exposures—the straight-line portion

Printing papers, unlike film, should always be developed fully, because they reach their full contrast at an early stage of development, and sbort development, by not allowing all the halde to develop, prevents the print from reaching its full richness and quality. Rather than attempt to alter the contrast by short development, we should change to a different contrast of paper or vary the composition of the developer.

There are two chief methods of printing of which one, contact printing has already been mentioned The other is projection printing Here we are concerned only with the theory, and that is very simple The negative to be enlarged-"blown up" in the trade-is placed in a projection printer or enlarging camera. An enlarging camera is mounted so that it may be moved easily along the lens axis The negative lies behind the lens just as in picture taking Behind the negative is an evenly illuminated light source If the lens is now correctly focused an image of the negative will be projected in front of the camera just where the object plane would lie in picture taking The device is a sort of hind side-to, or reversed camera, the image now being the negative, the object plane being the image to be printed. The lens and the paper support, or easel, may be moved so as to obtain any size projection of the negative The image is an exact replica of the negative and will print onto sensitized paper just as though the two were in contact

## COLOR PHOTOGRAPHY

We now turn from our discussion of first principles in photography to the theory underlying one of the most fascinating branches of photography, namely, the reproduction of color in color. The idea behind color photography is rather simple and has been understood since the nucleonth century. The practical problems encountered in developing consistent, workable processes have been and still are many and intricate. Progress today in this field is very rapid.

of the characteristic curve A gamma value of exactly one (10) represents a negative the contrast of which is an exact counterpart of the range of values of the original subject Ooe large film manufacturer is now including tables showing the developing time necessary to obtain various gammas. These are not important to the news photographer but are indispensable in color photography.

The human eye sees a few of the varying wave lengths of the material or energy we call light as different colors. We see either actual colored light, like a red lantern, or we see what we call colored objects which only reflect color to us. We say that a red lantern emits red light, we say that a red object looks red to us because the red object absorbs all colors except red, reflecting only red light to us. Green paint looks green to us because it absorbs all the wave lengths of light except those which our eyes interpret as green.

Examine any pure pigment other than red in red light. It will absorb all red light and since it is illuminated only by red light will appear black to the eye. In a green light, a red object will likewise appear black, while a pure green color will appear white, like the light source, in other words. Look at a piece of white paper with some red paint on it to a red light. If the red paint is really a pure red, it will disappear under the red light. The reason is that the red paint, hy being red, reflects all red light, and, since the light is also red, the red paint reflects all the available light and we see it therefore just as light as the white paper.

Color photography first had to take cognizance of this explanation of color phenomena. It next applied a principle discovered in 1807, namely that any or all colors may be produced by some combination of three primary colors, red, green, and blue-violet (usually just called blue). None of these three colors can be obtained from any combinations of any other colors, but all other colors may be obtained from some combination of these three

In order to avoid confusion, it must be noted that we are speaking here of actual color, color as sensation rather than color as pigments. The latter are not themselves, accurately speaking colored, but appear to have color only hecause of their faculty of absorbing and reflecting light wave lengths selectively. The primary colors usually used by the artist or photoengraver, akin to the familiar red, yellow, and blue, are a sort of converse—actually the complementanes—of the primary light colors and will be dealt with later.

Combining Primary Colors Let us see how we obtain other colors from our primaries. A pure red light added to a pure green light produces yellow light. This may be proved by shining a red spotlight on a white ground and then shiding a green spotlight over upon the red one, whereupon the mixture will produce a

in the subject, and since all other colors are made from some combination of the primaries, we have a record of all the colors in the subject

In order to turn our hlack-and-white color-quantity records into a colored picture, we project each image upon a white screen We use pure red light as the light source hehind the red record positive, for in doing so the red portions of the subject which were transparent on this positive will allow the red light to pass through and record as red on the screen In a similar way, the green-filtered positive is projected with a green light source, and the blue one with a blue light If these three images are drawn together on the screen into correct register, a luminous accurate color reproduction of the original will appear. The red light, as we said, shines through the transparent portion of the red trans parency to form red No other color will fall upon the spot which is supposed to appear as red, since in taking the picture with the other two filters we automatically prevented any red light from even entering the camera Only green passed the green filter, only blue passed the blue filter But a green portion of the object will appear green, since the green filter only allowed an image to he produced by green light leaving a silver deposit on the nega tive and a transparent portion on the positive

What ahout a yellow portion? Well, we saw that yellow light was composed of hoth green and red light. Consequently hoth the red and green lifters passed light through to that spot, so our screen image receives hoth red and green light, which combine or add up to form yellow. A brown object in the subject would reproduce correctly and would look brown hecause brown contains a certain portion of each of the primaries, and so a little of each would show on the screen, to just the same extent as they were allowed through the original "taking" filters. White results from equal amounts of all three colors, black from absence of all three. A gray results from a little of each of the primaries in exactly equal amounts.

That is the underlying principle of all color photography whenever employed today. It is done in different ways, but always on the same principle. The picture we have just achieved in color on a screen can be supremely accurate in its colors and in its interpretation of a wide range of light intensities, but it is an

awkward way of presenting a color picture, and it is not on paper

yellow hight If we now add a pure blue-violet light to the yellow, the resultant mixture will again go to white Remove the blue, and yellow remains, or remove the green, and the red and blue remain, giving a magenta hue If only red is subtracted, the blue and green remain, appearing blue green to the eye Combinations of these colors in varying degrees will produce any other known color. If then we can obtain an exact record to tell us how much of each primary color hes in each tint of our subject matter, we have made a start in duplicating the color sensation of the original.

Here, briefly, is how these principles serve photography. We may now make three ordinary black-and-white photographs of a colored object, each one taken to record the density range produced by each of the primary colors. So we make three separate photographs of some varieolored object. One is photographed through a pure red filter. The filter, being red, will absorb all colors except red, which it will transmit. Another negative is made with a green filter, which passes only green light reflected from the object. The third negative is made from a blue filter, and hence we have a blue record of the object, a black-and-white image affected only by the blue components of the light reflected from the object. These three filters, in the order named, are known as the tricolor set, A, B, and C, respectively.

Black-and-white transparent positives made from these three negatives would be a record of the amount of each primary color in the subject. A positive, in other words, of the red filter negative would show any pure red objects in the subject as white (white on paper, transparent on a transparency), while all other colors would appear as black or opaque. Actually few colors in nature are pure primaries, so we would have many shades of gray in the picture where natural this had contained small amounts of pure primaries which they had reflected. Similarly, the positive from the blue record negative would show blue as white or transparent, and all colors which contained no blue as white or transparent, and all colors which contained no blue as hlack, with colors containing some pure blue as varying shades of gray. A white section would be transparent, or white, on each of the positives.

We now have three positives, each representing accurately with a scale of silver densities the amount of each of the three primaries in the subject, and since all other colors are made from some combination of the primaries, we have a record of all the colors in the subject

In order to turn our black-and-white color-quantity records into a colored picture, we project each image upon a white screen We use pure red light as the light source belund the red record positive, for in doing so the red portions of the subject which were transparent on this positive will allow the red light to pass through and record as red on the screen. In a similar way, the green-filtered positive is projected with a green light source, and the blue one with a blue hight. If these three images are drawn together on the screen iato correct register, a luminous accurate color reproduction of the original will appear The red light, as we said, shaes through the transparent portion of the red transparency to form red No other color will fall upon the spot which is supposed to appear as red, since in taking the picture with the other two filters we automatically prevented any red light from even entering the camera Only green passed the green filter, only blue passed the blue filter But n green portion of the object will appear green, since the green filter only allowed an image to be produced by green light, leaving a silver deposit on the negative and a transparent portion on the positive

What about a yellow portion? Well, we saw that yellow light was composed of both green and red light. Consequently both the rod and green filters passed light through to that spot, so our screen image receives both red and green light, which combine or add up to form yellow. A brown object in the subject would reproduce correctly and would look brown because brown contains a certain portion of each of the primaries, and so a little of each would show on the sereen, to just the same extent as they were allowed through the original "taking" filters. White results from equal amounts of all three colors, black from absence of all three. A gray results from a little of each of the primaries in exactly could amounts.

That is the underlying principle of all color photography whenever employed today. It is done in different ways, but always on the same principle. The picture we have just achieved in color on a screen can be supremely accurate in its colors and in its interpretation of a wide range of light intensities, but it is an awkward way of presenting a color preture, and it is not on paper

Its color accuracy theoretically is limited only by the purity of the light filters obtainable, just as in the printing of color pictures onto paper or on a printing press the accuracy of the color reproduction is limited chiefly by the pureness of the dyes available. Theoretically perfect dyes have not yet been found for all the primary colors. The blue dyes are the worst sinners.

We can get a color print on paper from the same three negatives with which we started out We might proceed like this make three transparent positives from each of the three original negatives After being fixed and wished, the three trans parencies are bleached in potassium biehromate. Bichromates have the unique property of hardening (rendering insolvent in water) the parts of the gelatin which contain the silver salts the bleached transparencies are then swished around in warm water for a few minutes all the relatin which was unexposed-the high light portions of the image—will be washed away from the celluloid film support. Furthermore, the gelatin will remain sticking to the celluloid directly in proportion to the density of the image, this results in a transparent image of the subject detectable only as a deposit of gelatin of varying thickness blacks of the unbleached transparency will remain as full deposits of gelatin, the white of the subject will consist only of the celluloid base with all the gelatin washed nway, while all the middle tones of gray will be represented by gelatin deposits of varying thickness

The next step is to stain or dye each of the three transparent gelatin images with the suitable color, and then superimpose them upon a sheet of white paper. If this were correctly done we would have a paper print of our original subject in color consisting of three layers of tinted gelatin.

Our first thought would be to die red the gelatin image originally printed from the red filter negative, and similarly for the other two Suppose this were done, what would bappen? Something very far from the results anticipated because of the fact that in superimposing these colors upon a sheet of white paper we are not dealing with the addition of colored light as described in making our first color transparency, or more correctly, our light picture. We said that a red light added to a green light would make yellow light, but transparent red and green gelatin images placed upon a sheet of white paper are not

light images By placing a sheet of transparent red gelatin upon the white paper we color the paper red in effect, and a red-colored object by definition was an abject which absorbed all colors except red. The white paper reflects all colors, but the red gelatin continues to allow only red light through it, so that only red light can be reflected back from the combined gelatin-paper surface if the green transparency were piled on top of the combination we would see only black, since the red would allow only red light through and the green transparency cannot pass red light anyway. Thus no light would return from the white paper surface

Therefore to achieve on a speet of paper a natural color picture we must employ a different color approach from that used for adding colored lights. The adding of a light is called the additue process. We call the process used to print on paper—or any reflecting surface—subtractive, for when we place a color, whether dyed gelatin or pigment, on a white surface, we are taking away or subtracting color. The red gelatin absorbs or subtracts from the paper all colors but red.

We employ a rather roundabout means of coloring our paper priats. Red light subtracted from white light leaves blue-green light. We print the red-filter negative onto the white paper from a gelatin printer which has been dyed blue-green, for blue-green is white minus red. We print on paper not by adding colors (which would only add to black) but by subtracting them from white. We might look upon the matter as an inverse process printing with the shadows rather than with the lights.

Let us see what the dye colors should be White light minus red leaves hlue green, now called cyan when speaking of the hlue-green color as used in subtractive color processes, upon recommendation of the Society of Motion Picture Engineers White minus blue leaves red green, which we call yellow minus green leaves red-blue, technically called magenta. These, then, are our three subtractive printing colors magenta, yellow, blue-green, or cyan We call the positive made from the red filter the blue-green printer, the nne made from the hlue filter the yellow printer, and the one made from the green filter the magenta, or red, printer <sup>1</sup>

<sup>1</sup> Now suppose we follow the color changes of a photograph of three squares of 'colors' red white, and black The red filter positive we agreed

All practical methods of taking and printing color pictures represent some adaptation of these underlying principles

We always require three distinct photographic records for taking color pictures They may be made separately one after another, as may be done in photographing still-life subjects on an

to dye up in the complementary or minus color, blue-green. We called it the blue printer. The transparent portions of the positive, which would transmit red light if we are making an additive picture on a screen, will now leave bare white paper when printed. The black squares will be dyed blue-green on the paper.

The positive made with the green filter is dyed magenta, and the red aquaro will now receive a layer of magenta dye, since the green filter would record red as opaqueness, and we have dyed the opaque or shadow portions of our transparency printer with macenta dve Also, of course, the black

square will receive a layer of marenta dve

What color then, is the block square two-thirds of the way through the process? We reason it out this way. First, the white paper received a coat of blue-green, a cost of minus red. Thus, the blue-green absorbs red light, but allows both blue and green to reflect back from the white paper Bagenta, when is minus green, therefore absorbs green but allows the white paper to reflect back both red and blue. So we now have the blue-green dye reflecting blue and red. But the dyes are superimposed, and the magents dye reflecting blue and red. But the dyes are superimposed, and the magents dye cannot pass green given from the blue-green dye is absorbed by the magents dye Similarly, the blue-green dye cannot reflect red, so the red which was passed by the magents is absorbed by the blue-green dye. The only color which can reflect back through both the dye as from the white paper surface is blue, and at this point the black spot looks nure blue.

The same reasoning will tell what colors should result when we add the third dys image. The third, printed from our blue filter negative, is also dyed to its own minus or complementary color. Blue light subtracted from white leaves red and green, which we called yellow. The yellow-dyed

mage is now added to the paper

Again, since we are printing from the shadows, as it were, the red of our original subject, opaque in the blue filter timesparency, will now receive on the paper a layer of yellow dye. The magenta pigment already applied will, as we have seen, absorb green hight, tensant red and blue. The yellow dye absorbs blue (saree it is minus blue) but transmits red, so the square papears red, for the two dyes absorb one another's other transmitted color limitly, in the case of the square which is to become black, it is apparent that a layer of yellow imposed upon the bline will result in the absorption of the blue hight by the yellow dye, resulting in the transmission of no color, to black (The student should, by the same reasoning, demonstrate how to strive at a green colored print, starting with the taking of the picture)

ordinary camera Three separate negatives may be recorded simultaneously by the use of prisms and mirrors behind the lens to sphit the light beam into three components. Cameras constructed for this purpose are called "one-shot" cameras since they make the three records simultaneously. Again, the three negatives may be placed in very close proximity and exposed as one ordinary negative. The Defender Company's Tri-Pac is such a combination of negatives, the filtering being accomplished by using a color blind film (sensitive only to blue light) for the blue record and dyes for the other two films. If the three negatives are stripped together on one film support we get almost perfect register of the images automatically. Eastman's new Kodachrome film is made this way. Developing and processing of it are extremely difficult and at present can only be done at Roobester.

Sometimes the three negatives are combined onto one plate or film, not superimposed but juxtaposed. Here the film consists of a fine pattern of alternating red, blue, and green filters in the form of dyes coated on the film base. If the result is viewed with a magnifying glass it appears as many distinct spots of primary colors. Viewed with the eye, the dot formation disappears, and we see only those colors which filtered through each minute filter thus obtaining an additive color transparency by the addition or fusion of the minute spots of primary light. This is the method used on Dufay film. Finlay plates employ the same method except that the screen is not incorporated into the film. This allows any number of positive transparences from the original negative merely by placing positive prints in juxtaposition to a positive viewing screen, which correctly filters each individual spot.

In discussing the color taking materials we have already touched upon several of the means used to obtain the final result The Finlay and Dufay processes, being additive, can only be viewed as transparencies with each minute square of dye become a filter for the light source

The Kodachrome transparency is not additive Each of the three layers of emulsion, after being separately developed and then reversed, black to white and white to black to produce a positive, is dyed in the minus taking color to obtain the transparent color picture We could no more dye this film up in the

original taking colors than we could the gelatin matrixes used for paper printing because the primary colors would absorb the white light coming through and give only blackness for a result. The Kodachrome is three superimposed images, the Finlay trans parency is three images but three images broken into thousands of pieces and reassembled one piece next to another, and not one in top of another.

The methods of printing color onto a paper support are too numerous to mention by name. They all operate on the subtractive hasis. Many of them print dyes onto the paper by use of the bichromated gelatin described. Possibly the best known method is the Eastman wash-off rehelf process. The most beautiful results are generally conceded to be obtained by the Carbro process. It is not a simple process, and for consistent results temperature and humidity must be controlled. The print is composed of actual layers of bichromated Carbro tissues, which are supplied as unsensitized pigmented sheets.

Sometimes positive transparencies are made by the subtractive process. If the three dyed gelatin matrixes used for the wash off relief process are dyed heavily they may be bound together in register and viewed as a transparency instead of releasing their

dyes to a sheet of gelatin coated paper

Reproduction of colors in rotogravure is the phase of color photography of interest to the newspaperman press requires three printing plates toked up with the subtractive colors. In printing a fourth plate is also used black to give greater body to the black in the prioted result. The gravure expert's task is simplest if he can make his three gravure impressions by photographing them directly from the three original negatives. This means that the use of the one shot camera is the hest from the printer's point of view. He uses the original negatives for his screened plates and the color print as a color guide. When the engraver must use Kodachrome. Finlay, or Dufay for his plates he in turn must photograph the transparency to obtain three separation negatives.

Close cooperation between the cameraman and the gravure technician are essential for good results Before undertaking color, a newspaper should examine the facilities of its printing plant to know which color equipment cao be successfully adapted

to the plant requirements

#### A APPLICATION EXPRCISES

1 At the right of a sheet of paper, pivite upside down a 1-column halftone from a current new spaper. Let this indicate the image of the subject reflected through a cuners lens on a film. At the left of the sheet, draw a rectangle somewhat larger than the picture to indicate the original subject of the photograph. Between the two, a little to the right of the middle, make a heavy dot or tiny circle to correspond to the lens or aperture. Draw lines from the represented subject through the dot to the indicated image to show why a reflected image appears upside down when seen through the hooded brek of a camera. Explain your diagram

2 Referring to the diagram made for Exercise 1, write a brief explanation of why a given lens must be placed a definite distance away from the film surface in order to obtain a correct focus, or, in other words, in order to avoid.

a blurred or indistinguishable image

3 On this diagram indicate the term applied to the correct distance between the lens and the film for slarn indicers.

4 With a new diagram show how a proportionately longer focus lens will cause small, distant objects to fill up the plate or film to the edges

- 5 Clip from a newspaper published within the last month a picture taken with a lens which apparently had marked depth of focus. Explain the characteristics of the picture which indicate this depth of focus. If this picture had been taken with an extremely fast lens, what probably would have been the effect on the depth of focus? Explain why extremely fast lenses are found only on smaller cannets are:
- 6 Clip from a newspaper published within the last thirty days a picture which shows news cleinents in a clear focus but which shows evidence of title depth of focus. Fixplain what objects in the picture indicate the slight depth of focus. If, so the photographer of this picture, you had wished to obtain greater depth of focus, what procedure might you have followed? What offect would this have had upon your time of exposure?
- 7 Guen a lens with a speed of f/5 6, work out mathematically the amount of exposure it would require with the disphragm wide open in terms of the known exposure for a lens with the speed of f/11.3 Explain the proportionate difference in speed in the standardized series used by British and American manufacturers which enables you to determine instantaneously the change required in exposure when moving from one stop to another or to smother true.

## B ADAPTATION QUESTIONS

- 1 What is the derivation of the word camera? Explain what is meant by a "camera obscura"
  - 2 What is meant by a "6-in " lens?
- 3 Lyplum why the use of long focus lenses in portraiture appears to avoid perspective distortion
- 4 Explain why a tall building viewed at short range seems more perpen dicular to our eye on casual glance than it does through a camera lens.

- 5 What would be the f designation of a lens of 4-in focus and ½-in diameter?
  - 6 Explain what is meant by an anastigmatic lens
- 7 What is meant by the light-sensitive emulsion of a photographic film or plate, and what is its chemical composition?
- 8 When an image is reflected against light sensitive film in a camera, what about the reflection makes some parts, after development, appear black or gray, other parts light?
- 9 Why does a chemist speak of a developing solution as a "reducing" agent?
- 10 Why is a developed film culled a "negative"? Why can slot-machine cameras and street peddler picture takers turn out dry pictures more quickly than the film and printing method requires?
- 11 Explain function in contact printing of the light and dark areas of the film. After a developing solution has made the image clearly visible on the light sensitive paper, what about the chemistry of the process makes it necessary to place the print in a fixing bath?
- 12 Explain the two difficulties of light refraction which are counteracted by the use of a compensating lens
- 13 Explain the limitation in the earliest days of film manufacture which is corrected by the panchimmatic film used today. What limitation of panchimmatic film often needs to be corrected, even at the sacrifice of extreme speed? What device is used to make this correction?
- 14 The ultimate effect of increased exposure of a film is to increase the jacs of allver deposit on the film after the developing solution has reduced the silver bromide to minute particles of metallicaliver. In the thirdly exposed portion of the negative, if we double a given exposure, the ultimately resulting density of silver deposit increases faster than the rate of exposure. In the densely exposed portion of the negative, the density of silver deposit increases less than the rate of exposure. With these facts in mind, explain what is meant by the "characteristic curve" in understanding the way in which density of film varies with exposure.
- 15 In what portion of the characteristic curve lies the theoretically correct exposure?
- 16 If the range of light values to be photographed is less than the straight-line portion of the characteristic curve, can there be more than one equally correct exposure? If there is a long scale of values from light to dark, what must occur to prevent some of the values from being sacrificed?
- 17 If the most brightly lighted area of a subject to be photographed is about 300 times as bright as the darkest shadow area, could this range of values be faithfully reproduced on a fast panchromatic negative? Justify your answer Could this range be reproduced on a printing paper? Explain the reason for your answer.
- 18 What instrument can be used to determine the correct exposure for studio portratture or copies of pictures or pages from hooks? Is such an instrument useful in the usual experience of the news photographer? Justify your answer

- 19 Can changes in the developer, or in the time of development, alter the contrast of the negative? Can they after the relation between the tones? Explain the reason for each of your answers to this question.
  - 20 For what purpose is projection printing used?
- 21 What is the difference between light emitted from a red lantero and the color we see reflected from a woman's red kini dress in ska) light? Whit will be the effect of looking at a pure green pigment in a dark room lit only hy a red light? How will pure red ink marks on white paper look in a dark room under a red light?
- 22 What have the principles suggested in the previous question to do with color photography? What other principle of color phenomena discovered in 1807 is also involved in color photography?
- 23 Suppose we shine a red spotlight on a white ground If we then slide a green spot over the red one, what sort of light will be produced? If we now add a pure blue-voice light to the mixture of red and green light, shat will be the result? Suppose you now remove the blue Is there any limit to the colors you can produce with varying degrees of these given colored lights?
- 24 What developing agents are most commonly used in newspaper darkrooms? What two reducing agents are commonly used for fine-grain developing?
- 25 What chemical characteristic of developing agents makes it necesvery to add sodium sulphite to the solution?
- 26 What characteristic leads to the customars addition of sodium carbonate?
- 27 What is chemical "fog"? What chemical is used in a developing solution to prevent fog? What other values is this added chemical said to possess?
- 28 Distinguish between the hasic principle of the additive process for projecting a color picture on a screen and the subtractive process of printing a color picture on paper. Why will the additive process not give us a correct color result on paper?
- 29 Explain why the subtractive process may largely be spoken of as "printing with shadows rather than lights"
- 30 If we subtract red light from white light, what results? Blue light from white? Green from white?
  - 31 What is a one-shot camera for color photography?

- 5 What would be the f designation of a lens of 4 in focus and ½ in diameter?
- 6 Explain what is meant by an anastigmatic lens
- 7 What is meant by the light-sensitive emulsion of a photographic film or plate, and what is its chemical composition?
- 8 When an image is reflected against light sensitive film in a camera, what about the reflection makes some parts, after development, appear black or gray, other parts light?
- 9 Why does a chemist speak of a developing solution as a "reducing" agent?
- 10 Why is a developed film called a 'negative"? Why can slot machine cameras and street peddler picture takers turn out dry pictures more quickly than the film and printing method requires?
- 11 Explain function in contact printing of the light and dark areas of the film. After a developing solution has made the image clearly visible on the light-sensitive paper, what about the chemistry of the process makes it necessary to place the print in a faine bath?
- 12 Explain the two difficulties of light refraction which are counteracted by the use of a compensating lens
- 13 Explain the limitation in the earliest days of film roanufacture which is corrected by the panebromatic film used today. What limitation of panchromatic film often needs to be corrected, even at the sacrifice of extreme speed? What device is used to make this correction?
- At The ultimate effect of increased eyosure of a film is to increase the layers of silver deposit on the film after the developing solution has reduced the silver bromide to minute particles of metallic silver. In the thinky exposed portion of the negative, if we double a given exposure, the ultimately resulting density of silver deposit increases faster than the rate of exposure. In the density exposed portion of the negative, the density of silver deposit increases less than the rate of exposure. With these facts in mind, explain what is meant by the "characteristic curre" in understanding the way in which density of film varies with exposure.
- 15 In what portion of the characteristic curve hes the theoretically correct exposure?
- 16 If the range of light values to be photographed is less than the straight-line portion of the characteristic curve, can there be more than one equally correct exposure? If there is a long scale of values from light to dark, what must occur to prevent some of the values from being sacrificed?
- 17 If the most brightly lighted area of a subject to be photographed is about 300 times as bright as the darkest shadow area, could this range of values be faithfully reproduced on a fast panchromatic negative? Justify your answer Could this range be reproduced on a printing paper? Explain the reason for your answer.
- 18 What instrument can be used to determine the correct exposure for studio portratuter or copies of pictures or pages from books? Is such an instrument useful in the usual experience of the news photographer? Justify your answer

- 19 Can changes in the developer, or in the time of development, alter the contrast of the negative? Can they after the relation between the tones? Explain the reason for each of your answers to this question.
  - 20 For what nurpose is projection printing used?
- 21 What is the difference between light emitted from a red lantern and the color we see reflected from a woman's red lant dress in day light? What will be the effect of looking at a pure green pigment in a dark room lit only by a red light? How will pure red ink marks on white paper look in a dark room under a red light?
- 22 What have the principles suggested in the previous question to do with color photography? What other principle of color phenomena discovered in 1807 is also involved in color photography?
- 23 Suppose we shine a red spotlight on a white ground. If we then slide a green spot over the red one, what sort of light will be produced? If mon add a pure blue-violet light to the mixture of red and green light, what will be the result? Suppose you now remove the blue. Is there any limit to the colors you can produce with varying degrees of these given colored lights?
- 21 What developing agents are most commonly used in newspaper darkrooms? What two reducing agents are commonly used for fine-grain developing?
- 25 What chemical characteristic of developing agents makes it necessars to add sodium sulphite to the solution?
- 20 What characteristic leads to the customary addition of sodium carbonate?
- 27 What is chemical "fog"? What chemical is used in a developing solution to prevent fog? What other values is this added chemical said to possess?
- 28 Distinguish between the basic principle of the additive process for projecting a color picture on a screen and the subtractive process of printing a color picture on paper. Why will the additive process not give us a correct color result on paper?
- 29 Explain wby the subtractive process may largely be spoken of as printing with shadows rather than lights?"
- 30 If we subtroct red light from white light, what results? Blue light from white? Green from white?
  - 31 What is a one-shot camera for color photography?

#### CHAPTER V

### NEWS CAMERAS

## PREVIEW QUERIES

Why cannot news photographers use the fast compact little can did camera for all purposes?

What does the picture reporter do for shots inside a courtroom or hospital ward where flash bulbs are forbidden?

What five improvements need to be made for tough adaptable speedily operated news cameras?

Can candid pictures be taken u th the bulky Speed Graphic?

What is the best camera now known for taking detailed shots of baseball from the press box of celebrities in a parade or of a bridal procession emerging from a church?

How is a poor print with a high news value made fit to reproduce? Why would a news photographer use a fissb bulb speed gun when a bright sun is already shunng on his subject?

THE news photographer requires a camera with four features present in some degree, and necessary approximately in this order (1) adaptability to meet any picture taking situation, (2) rapid operation, (3) compactness and portability, (4) indestructibility

Obviously no one camera can satisfy all these requirements equally, nor will every photographer agree that any particular machine best meets the requirements. But at any given time some one camera will be used by almost all newsmen. That they use this one type of camera seems just to happen although there are good reasons for it. On the large papers it means that parts may be interchanged quickly and that one man can borrow another's camera and operate it immediately. Also it means that negative holders can be borrowed from fellow workers while on location and that, where several men are working on one picture no one man will have to take a very much longer time in getting his picture or be compelled to have more elbow room or crowd much closer to the subject than another man

For some years now in most sections of the country the generally accepted "box" has been Eastman's Speed Graphic taking a

film holder already in the camera and with the slide withdrawn ready to shoot

The camera is all-purpose and not just an action recorder. The photographer can mount it on a tripod, replace the usual  $5 \text{\frac{M}}$  in f/4 5 2 cms Tessar lens with a wide-angle or telephoto lens, raise the lens board to eliminate foreground, and obtain satisfactory architectural views. Or he can rack out the hellows to twice their normal length, focus sharply on the ground glass, and

Photo by John Mills Jr
Fig. 11 -- Rapidity of operation is the most important factor in any news

camera The subjects cannot be posed as for a studio portrait
get copies of printed matter, or close-ups of bullets, or what you

will
So much for the adaptability of this camera, with a speed gun
and flash bulhs, a tripod, an extra lens or two, and maybe a filter
and lens hood, the photographer can photograph almost anything
—not so well, perhaps, as if be used a specialized camera for each
purpose, but he cannot take a carload of equipment on a news
story!

However, adaptability is not the sole enterion Rapidity of operation is almost the sine qua non of news work (Fig. 11) Undouhtedly there are other cameras than the Graphic better qualified for all-around work if speed were not so vital The

modern ministries with their endless accessories are versatile enough, so also are some of the folding metal enmeras. None of them can be operated so quickly as the Graphic nor converted to different photographic functions as ramily.

Th return the first shot of an important news event to the darkroom is a simple inatter when it only require sending in the first
platcholder exposed. The problem is not so simple when all the
negatives are on a single strip of roll film. Anyone who has ever
tried in set up and adjust the folding metal cameras are even the
contax, for that matter, in zern weather, waiting numbly for the
action in break finding his fingers too stiff in move knows the
advantage of the relative bulk and the cumber-ome-looking levers
on the Graphic cameras. Any camera which can be adjusted
with mittens warrants respect, and the farther north, the more
respect

After operations in a pouring rainstorm a Gmplife is a positive pleasure to dry in compart on to saint of the more complex cameras, and in extreme cases salvage to its do not run so high! The Graphic is a tough camera. This can be appreciated after bouncing it on a pavement, when a little scotch tape and hape can generally be counted upon to keep it from falling apart before the assignment is completed.

Finally, as to comprehense it is not compact as we consider cameras today. But it is not persent the most useful compromise between usability, ease of operation and portability. The technical improvements introduced by the miniature cameras are having their effect upon the Graphic. Alteady a 314 by 414 and a 214 by 314 model Graphic with an attached range, finder to obviate the old guess focusing is gaining recognition.

There is a hmit, of course, to the smallness of the negative which news photography can use. Small size requires special ear (which means more time) in dividoping, the scratches and dust which come with haste are ruinous. Especially in sport netting use can often be made of only a small segment of a negative A small section of a very small negative is not much use, and the alternative of long focus leases on the small camera is not always practicable because of the time involved in changing leases.

Nevertheless, the time is not far distant when the news camera as we know it now will be outmoded much as are old radios with their auxiliary ways traps loud-speakers and exposed parts

The coming news camera probably will have absorbed the speed gun and range finder into its mechanism, so that the camera will be an integral mechanical unit with all parts built in The size will probably be somewhere between the 35-mm miniature negatives and the 3½ by 4½ m size, as small as possible to gain portability and depth of focus without sacrificing ease of manipulation either in the camera or in the darkroom work

There is no reason why someone could not, by devoting half as much designing ability as has already gone into the Leica and Contax cameras produce a really well built, sturdy, integrated news camera. The demand is certainly great, and the first manufacturer to capitalize on it with a product designed for and with the aid of news photographers should reap a small fortune.

Why should the speed flash necessarily stick out from the camera like a pawnshop sign? Why does a range finder have to be screwed on as an obvious afterthought? Range finders are now being screwed on inside the camera, which is a step in the right direction In a few years range finders will be actually built in, or "designed" in, as it were Why can not the lens board of the news camera be tough and rigid and still be movable for certain types of shots? Why can not lens hoods be fashioned which will not drop on the heads of spectators, surely manufacturers have heard of bayonet locks Some bave, specifically the makers of two well known cameras which also allow filters to be easily clipped into the lock on lens hood. Why is it not possible to simplify the photographer's focusing troubles by making a catch to allow the lens to click into a hyperfocal point, somewhat as is already done on the new rapid sequence camera called the Robot.

Why does not some smart manufacturer canvass the opinion of alert news photographers, gather some words of advice, and build a really modern news camera? It can be done, and the photographers are crying for it. It can be done, too, without sacrificing rigidity, case of operation, or adaptability. American manufacturers still have much to learn from the imported cameras and from motion-picture equipment, even allowing for price considerations. But there are signs of progress. Eastman has now introduced an "automatic" amateur camera. In a few years the manufacturers of this country may have caught up with the

demand and America may usure the position of foreign manufacturers and make the best goods available snywhere—It is to be hoped that they will, and not alone because of import duties

The Speed Graphic is good, but it is good only hecause we know nothing better now for that particular use. The modern mininature cameras have outstripped it and shown it up for what it is, a hangover from grandmother's day, with modern improvements tacked onto the sides like the exercecences adorning the airplane before it came of age. The Speed Graphic has many drawbacks, but it will not always be used in its present form, nor has it always been used. Folding metal cameras had their vogue, in the 4 by 6 size, as well as the ever-useful Graflex in the unwieldy 5 by 7 size. In fact until rather receoult the Graflex (the reflected ground-glass image camera) was predominant in the Far West and Southwest, the reason being that the bright sunny weather seldom demanded flashlight equipment.

At this point the amateur cries yes, we know what you sud about the Speed Graphic, but we think the newsmen suffer from inertia, and why do they not go out and give the miniature a real try? It works for us, look at the pictures of the Hindenburg explosion!

Well, Mr Amateur, you are right—a little You could cover all stones with the miniature, but you would find yourself in an awful jam in the darkroom with a city editor elamoning for photographs. And on a nice hot day, if you did not process your 35-mm film very carefully and it melted, melted just a little, that would be the end. You can do everything but boil a 4 by 5 negative and still save it—enough. The light has been turned on one during developing and it has come through the ordeal—a little dense, perhaps, but printable.

As we admitted, the smaller negative for the news camera is on its way, largely because of the minature's influence It will not be quite that small, and it will not bave "arrived" until processing methods allow more leeway in operating, allow for more mistakes and haste Right now the news photographer is availing himself of the minature, but not exclusively so It is not his only camera, although this may not necessarily be true of the feature man or of the chap who specializes on certain subjects. The amateur had one leg to stand on when he spoke of the news photographer's resistance to the minature, his ridicule

of it, and his tardy acceptance of it even as an auxiliary instrument. Not all newsmen ridiculed it although they may have taken to it rather cautiously. That attitude should be comprehensible, the photographer's job depends upon his producing the picture, so he can be readily excused for adhering to the tried and true until he has seen the youngster's performance. To the amateurs a vote of thanks for their ground breaking!

To return to the subject of cameras just where does the newspaper employ the ministure? Almost everywhere today. The camera is small enough so that it can be carried in the regular Graphic case with the platcholders and flash bulbs. The clearest way of explaining how and where the ministure is used is to describe its functions and then assume that the newman uses it for what it is mechanically best suited. It has four chief claims to superiority over other cameras. Being small, it is relatively inconspicuous, it has extreme depth of focus (ability to keep objects not in the plane of focus fairly sharp), it offers a lens fast enough (admitting sufficient light) to allow instantaneous exposures in artificial light, the film and shutter can be reset simultaneously and very fast.

We need only to suggest the types of pictures for which this camera is uniquely qualified. The courtroom scene, where for one reason or another it becomes inexpedient to blow flash bulbs or flaunt a camera is one type of picture. The electrically lighted hospital ward, in which flash bulbs are forbidden, suggests another use for this camera Flash bulbs create a harsh, flat lighting, the ability to utilize ordinary lighting conditions lends naturalness So the candid strip of the mayor performing his daily stint at his desk becomes fodder for the miniature effect produced is naturalness-nothing obtrusive like flash bulbs to unnerve the subject-and the shots are made one after another so that a sequence of action can be followed through and preserved for the reader The miniature camera is suitable for stage photography, of course—the scene photographed from the flagpole, mast, or open airplane, where at least one arm does duty as a makeshift safety belt

The examples could be continued indefinitely. The point to observe is simply that the good craftsman uses his tools for the purpose to which they are best suited. Think about the state-

ment on the unique qualities of the miniature and you will see why, for the present at least, the newsman is not using it exclusively

In the last analysis it is the man and not the instrument which is important. Experienced men have performed tricks with their bulky 4 by 5 Speed Graphics—still are performing them—which out-candid the candid cameras. The tale of the demon golfer who turned in a good score when using a shovel, hoe, and rake contains a moral. The greatest sin perpetrated in the name of the miniatures is tacitly to insist that they alone are the candid cameras. They are not. There are no candid cameras. There are only candid pictures. To call the miniature a candid camera is to confuse a type of picture with some particular mechanism. For good candid pictures hefore the advent of the Leica, the reader is referred to the pictures made by Brady during the Civil War, with a view camera, wet plates, and a portable darkroom tent, or to those of Atgét in Paris at the turn of the century, or to any file on the World War.

Only passing mention need be given the "view" eamera Newspapers employ it for architectural subjects, real estate work, portraits and studio work. It is used on these jobs because it is the best camera for the work. A view camera has a ground glass but no focusing scale, range finder, or view finder, and consequently must be operated on a tripod. But its two ends, the lens hoard and the ground glass, can be turned, twisted, and shifted into almost any relative position. Buildings which lean hackward on the ground glass can be righted, very wide-angled lenses can be slipped on to get internor views, and the back of the camera can he swung to keep wall lines perpendicular. Longfocus lenses can be used to get large head images for portraits, and when the camera is all screwed into place it will not wobble

Perhaps the most distinctive camera the larger newspapers use is the Graflex converted for sports pictures. To a 5 by 7 Graflex is fastened a long hed on which shdes a hlackened housing built out from the hellows, the front end of the contraption is either a large telephoto lens or a very long focus one. The image of a distant object seen in the ground-glass hood by means of the reflecting mirror looks about the size it would to the naked eye. Since the lens has a focus length of from 20 in to an occasional

40 in and is large enough for speeds of f/4 5 or f/6 3, the camera will be a little unwieldy for ordinary photography

It is usually 214 to 3 ft long and may weight 60 lb

For baseball pictures it is unexcelled Pictures taken in the press box or on the sidelines when enlarged, almost show more detail than could be detected by an observer at the same location Not infrequently the camera will be perched atop a building cornice and trained on celebrities in a parade, or upon a welding emerging from a church doorway Occasionally it finds other uses, for example, in nature photography Since the 28-in lens alone for this rebuilt camera lists at about \$570, the outfit is not worth the price unless good pictures of baseball or football are continually needed

One other camera deserves mention because it is destined to effect the evolution of the news camera even more than the 35-mm miniatures. The Rolleiflex is of the reflecting-image type but is more compact than most reflecting cameras, is quickly adaptable to either waist-or eye-level shooting, and has a rapid and efficient film winding mechanism. One lens for the picture taking and another for the ground glass image avoids resetting the mirror and the disappearance of the image just before exposure. Generally employing a negative about 2 in square, it is bulkier than the Leica but less so than the Speed Graphic. With a speed-gun attachment it now finds use as an excellent camera for feature work, and its design unquestionably will influence greatly the press camera of the future.

The complete coverage of night sports events demanded by the and picture lookers until very recently was obtained almost entirely by means of the speed gun on the Graphic Some large metropolitan papers had been using 6 in f/27 or 2 9 lenses mounted on Graphics or on somewhat similar German cameras for this purpose Obviously this degree of specialization was uneconomical for all but the larger papers, and further it was not always possible because only in the larger arenas was there bright enough light to allow exposures of  $Y_{500}$  see The Contax cameras found some use for this function, but again the slowness of negative processing was a senious drawback for the morning newspapers

In 1937 a new film was introduced with a speed four times that of the then fast films — It is already resulting in the discarding of

the speed gun under many light conditions including night sports again coming a step closer to realism in photographs. The dramatic quality of the natural light in the ring or the lockey game becomes the source of illumination and the picture gains immeasurably as an exciting and pictorially interesting document

Tittle more need be said about lenses in this chapter. The universally standard 514 in Zei, a Teesar is in its speed class also little universally self or defining power and go neral excellence. Leonomy should never be practiced at this point. However, for the copying camera and the architectural cameras a much chapter lens will do the jib just as well. Speed is not essential for these two functions and chapter slover speed anastigmatic suffice. If a good used rapid rectilinear (roos-anastigmatic) can be purchased at a hargain it should by all means be obtained for if used stopped down it is an excellent lens.

Most lenses purchased from reliable dealers will vary in quality with the price. Used lenses are always worth buying from reliable dealers who will give trial and exchainge privileges so the photographer can determine to his own sati faction just how expensive a lens helpletes necessary for each particular number.

Filters are not frequently used in news work, they slow down exposures and take time to clip on and take of. A light or medium yellow filter, which absorbs the violet end of the spectrum and records clouds well on the film, is a useful adjunct to any camera kit, especially for the general view, which will have a nicher and more realistic quality when a correction filter is employed. Croud horse shows beach scenes snow scene—all these are better pictures when taken with a filter. Light yellow filters do not increase the exposures on panchromatic materials appreciable.

The architectural cameras and the copying cameras should be equipped with several filters—Red filters—and now the new polaroid filters which polarize light—will give startling black sky effects and, in the case of the polarizer, eliminate reflected glare from most nonmetallic surfaces.

Meeting Standards for Copy Newsphotos are judged as explained in Chapter III, on the ba is of content and copy. By copy is meant all those qualities of the photograph which make it good or bad as a subject for reproduction. This section will deal with the nyrs picture as copy.

It goes without saying that the news photographer, not working under controlled studio lights, seldom realizes perfection Always his picture taking is conditioned by his realization that the end product is a halftone screen engraving of ink smeared on newsprint—not the beautiful "salon" print of the amateur—and he continually works to get, with the conditions in which he operates, the most suitable results for his medium

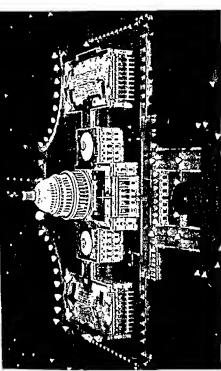

Personahty, news and action—these are the underlying elements of content. And what are the elementary materials of copy? Not much a scale of grays from a light gray to a dark gray. Not even from a good pure white glossy paper to a shiny black ink. The halftone of the newspaper has, even in the so-called high lights a slight dot formation which grays down an already grayish paper. The blackest portion of the picture will have tiny holes or unprinted dots of paper showing through the ink, making the black much lighter in tone or value, than a black on a good clossy paper.

So the newspaper photographer starts with a large handicap He faces an aggravated form of the problem confronting every photographer (and artist) The problem is to translate, with effectiveness and relative accuracy, the great range of light to dark—of luminosities—in the original subject into the greatly condensed range of tones offered by white paper and black pigment (Fig. 12). The bright clouds of a landscape can be represented by no brighter tone than the white of paper, the blackness of a cave cannot be depicted any blacker than the iolavallable. The range of tones is all bunched together, as it were, some of them getting merged with others or squeezed entirely out of the neture.

From visual training habits, our eye clongates the range of tones, in other words, we accept the convention of a short-tone range much as we accept the artist's line to indicate what in nature is not a line but an edge. We see only the short range of tones on the paper, but imagine it in much wider range like the original subject. Yet this range is more constructed in the news paper. Cut from a newspaper photograph the lightest portion and the darkest. Compare them side by side with two sections taken from a good snapshot the lesson is startling.

We said the eye accommodates to tonal differences, or imagines them greater than they are That is true, but it is equally true

Photo by Harry Goodwin

Inc. 12.—The whole range of luminosities, from the brightness of light to the blackness of might, must be compressed by the skilled cameraman into a short scale of values. This first successful might were of the Nation's Capitol was made from a blump at The camera was a Leica, exposure Ho of a second at f 1 5 on Agia Ultra Speed Pan film an altitude of 1200 feet, that the arrangement, within the picture itself, of the various shades of gray has much to do with just how brilliant or lumnous the picture appears to us. Have you ever seen in a rotogravure section a photograph of sunlight glistening on water at which you almost squint because it seems to be so hright? Yet the same seene differently lighted could be reproduced to look dull and grayish on the same paper and ink. The point is that the photograph can vary immensely, within its narrow tonal confines, in the degree of brilliance which it seems to your eye to possess

Imagine a photograph constructed of o myriad of small patches of paper. The photographer has five boxes, each containing patches of a different shade of gray. The lightest are no lighter than the piece we cut from the newspaper, nor is the darkest any darker than the newspriot ink. He now makes a mosaic of these pieces to form a picture. He makes it a dull, lifeless gray or he makes it fairly sparkle with lights and shadows—whichever he will. These patches of gray are, in effect, the elements of copy, the building stones of the photograph. If the photographer knows the rules governing their arrangement he can suggest any degree of sunoy lightness or impenetrable hisckness.

There is no complete manual of rules There are only a few underlying principles—principles which apparently have been found to exist by a process of trial and error Originally they were probably stumbled on by painters, later somehody called them rules The value of attempting to state them dogmatically, even a few of them, is questionable. They must be absorbed to be learoed, unlearned to be used, and only in the actual taking of many photographs can they be well harnessed, and, when they are, the whole process is carried on without the aid of conscious thought

Almost too obvious to mentioo is the semimechanical requisite of getting good contrast in the prints which go to the engraver "Contrast' means brillance, white whites, black blacks, very few intervening shades of gray, and plenty of hlack ond white juxtaposed. Thus, o face used as a 1-column cut will be more recognizable if the lips, eyelashes, hur, and edge contour are all dark against the light skin, the same foce engraved directly from an old cabinet photograph would lose in reproduction any defining characteristics because the tones are oll hunched up into deheate

grays The art department would have to apply a little lamphlack judiciously

Photomechanical reproduction methods are becoming better and better. The old admonition to the young photographer to get contrast and then more contrast grows less necessary each year. This does not mean that the photographer can expect the engraver to pull a good proof from a dull grayish print, the photographer must still deliver a "snappy" hilliant print. However, it does allow the photographer increasing leeway in his use of light in the picture. As reproduction approaches perfection, be can concentrate on getting the desired pictorial effect in bis lighting and need not worry so much about black against white provided the print as a whole includes a full tone scale.

A given shade of gray assumes a relative value to the eye of hightness or darkness by virtue of the value of the toncs which surround it. That is the key to the whole business of apparent tone values. A photograph, a painting an etching, or just a group of blobs of color will seem to contain brilliant luminous whites if most of the area is relatively dark. Suppose a sunset seeme when cut into little pieces and analyzed is found to have about one fifth of its area the lightest shade of available gray, about two-fifths to have a rather dark gray, and the remainder the nearest to black obtainable. The sunlit clouds will appear exceedingly bright to the eye, whether the picture be on the motion picture screen—which has a very long range of luminosi ties—or whether it is reproduced on a gray newspaper. The principle is an old one to painters, Rembrandt worked it superlatively

A sort of obverse of this effect applies to "high-key" pictures, executed supposedly entirely in grays and whites It is a difficult type of picture to reproduce in a newspaper for obvious reasons, although it can be accomplished successfully if run large. The grays and whites of the picture will appear lighter by contrast if even a very small amount of black is included. The minute quantity of black sets off the lighter tones and hy contrast they gain a silvery quality, and for the same reason the whites—light grays on our picture—are applied spanngly, the high lights will then fairly glisten.

Variations on the fundamental principle of tones may be created by changes in the direction of the light source illuminating the subject. Here there are unlimited possibilities not alone for

emphasizing a particular mood, but also for adding contrast to aid reproduction

Faces illuminated from below may look weird and dramatic. The familiar back lighting may contribute a feeling of sunniness. Occasionally lighting a face from both sides, high-lighting the edges, finds use. For lighting, being the very essence of photographs, not only serves to econvey mood or feeling, but also serves to define the subject matter (Fig. 13). A light properly applied can emphasize the texture of a skin, narrow a too round face, give sparkle to a snow scene, or, under other conditions, cause it to look like a dirty gray blanket.

Seldom does the news cameraman bave as much control over his lighting conditions as is implied in the last paragraphs could have control in the studio, but certainly not to any extent in the field He cannot carry a battery of high-powered lights and reflectors along as Hollywood does, want for the sun, and choose his background at will When he does have a choice he must know precisely what effect he wants and work fast to obtain it More and more he is achieving some measure of control in his light Here are two cases in point A group outdoors in the sunshine with the sun near the zenith may be photographed with a speed gun for facial illumination, using the sun as an effective back light The result may be excellent from the standpoint both of the sparkle it gives the print and of the added contrast for the engraver In recent years several news staffs have supplied their speed guns with a 10 or 15-ft extension cord so that the light source need not be directly beside the camera but can be held high, or low, or to one side by a volunteer drafted for the moment We gain interesting lighting in subjects which had heretofore always been done with the same monotonous flat illumination Here again the freedom from the necessity of using the flat speed gun lighting offered by the new high-speed film already mentioned is a substantial help to the news photographer in achieving dramatic and realistic effects

# GETTING MORE CONTRAST

Before discussing darkroom methods we shall examine hirefly the technical means which the photographer employs—aside from what choice he has in arranging his subject and light—to gain contrast in the print when it is lacking in the subject Not a week passes without a news photographer somewhere having to cover some outdoor activity when the sun is obscured—pictures at dusk, in the rain, on leaden winter days—even California does not spell immunity. Under certain conditions the range of tones in the actual subject matter may be less than the range of tones available on the paper, the scene may go from the white of a face to a middle gray, with no blacks. A football game on a drizzly day late in the afternoon—we hope the photographer does not have to cope with this particularly difficult situation—will result in a soft dull print if it is processed in the ordinary manner. The engraver wants more contrast than was in the subject, more than there is in a straight print, hecause his processing will further shorten the tonal scale.

There are but two things the photographer can manipulate to get his result, the negative and the print Generally be gives both a workout As a negative is developed the so-called latent image becomes visible (were we to watch it) until all the tones of the subject are present in approximately their true relationship Long-continued development has the effect of stretching the tones even further apart, in other words, of making the dense portions even denser without materially changing the transparent por-So the photographer "develops up" his negative as far as he knows it can be forced If it is still going to print too gray, he "intensifies" it, which means further blackening by ono method or another of the already dense portions Sometimes he may deliberately underexpose his negative in the first place, it may belo, though for a different reason. It is a risky procedure. for if he exposes too little nothing can evoke an image where none exists!

To print this negative he uses a "contrast" paper. It will accentiate or stretch out the tones in the negative, tending to make very white the slightly dense areas of the negative and very black the thinner portions. Probably be used a "concentrated" developer which itself helps to produce a contrasty result

Generally these expedients suffice Any minor flaws will be remedied in the art department. But if the result is still unsatisfactory—say because of insufficient exposure—several expedients may be resorted to, although so seldom as not really to warrant mention. The print may be copied onto process film. The resulting negative may then be treated in the same way as the

original one. The final result is more likely to resemble a charcoal drawing or an etching than a photograph, but something is better than nothing if the subject rates 100 per cent. The more complex the process of manipulation the less value it has in the news darkroom because speed and its corollary simplicity must ever he the guides

Once in a long while the opposite problem in contrast presents itself. A suplit waterfall in a dark wood is a stock example Here the lightest areas of the scene may be 50 or 500 times hrighter than surrounding areas. If the photographer has succeeded in getting this long range of values all into his negative -assuming that he wants it all, for pictorially he seldom does-if he gets it all in, as he usually can, he will force it all into the print by "dodging" or "shading" This simply means allowing a little more exposure on those portions of the print which might otherwise stay too light-in this instance the waterfall making the colargement he will cut off the light beam from all but the waterfall and give it a little longer exposure thereby This is accomplished by holding the hands somewhere between the enlarger lens and the paper, in the path of the light image One soon masters the knack of making hands and fingers block out-or outline-recalcitrant portions of the picture image For shading minute areas, stencils may be quickly cut out and beld in the light path 1

When he cannot preserve these relative values on the negative, there is no real alternative, provided he used a soft, noncontrast film, except to overexpose by far and give very short development. This will alter the relative values, but will provide detail in the shadows without allowing the waterfall area to get so dense that it loses the subtle tones within its own area. It is seldom necessary to have recourse to this trick, and that is just as well, for it, secroticity falishes gradation, and "cendis" or produce prints which look gray and flat

After this discussion, one might be led to think that the newsman must constantly worry about his range of tones, gradation, and whatnots In practice, of course, he concentrates con

<sup>&</sup>lt;sup>1</sup> Dodging and shading of course are also resorted to in contact printing Bits of paper for example are laid on the illuminated ground glass beneath the negative rest of regular contact printers thus witholding light from the desired areas

sciously only on his subject and the technical problems are so thoroughly ingrained that he adjusts his camera almost by second nature

#### A APPLICATION EXERCISES

- 1 Clip from a recent newspaper or picture magazine two or more pictures which probably were taken under conditions which made a camera of rapid operation and virtual indestructibility highly advisable Explain the probable conditions
- 2 Clip and mount five or more recent news pictures which suggest the reason why adaptability to any picture-taking attuation and portability are necessary for a newspaper camera of general use Explain the probable conditions which justify your selections
- 3 Clip from a recent newspaper or magazine a picture in which tone contrast is less marked than desirable. Clip one which showe excellent attention to tone contrast in a situation where lack of contrast might easily have resulted from inexpert photography. Write brief explanations
- 4 Clip recent news pictures in which the spot facture or other conditions indicate that the picture could have been returned to the office and a cut made of it much more in keeping with the probable newspaper conditions if taken with a Speed Graphic than with a miniature Justify your selections
- taken with a speed Graphic than with a miniature Justify your selections
  5 Clip recent news pictures which could have heen taken quite satis
  factorily with a miniaturs Explain why

For those having cameras

- O Assume that a university student in your town has just received notice that be has won a \$1000 prize for a short story written around an illustration published by a national magazine Get a friend to pose for an interior shot of this hypothetical prize winner working on a story in his room Watch lighting effects, action of facial expression and news content. Rate the neture for both content and copy.
- 7 Take a picture of a small group, using hright sunlight for back lighting, a speed gun or separate flash hulb for face lighting.
- S Select the most interesting landmark in your town. Take a picture suitable for newspapers, getting action effect white a reasonable angle shot, watching tone contrast, and including if practicable, luving figures. Write a 20-30 unit overline and a 40-60 word underline. Rate the picture for hoth content and copy
- 9 With the fastest film obtainable in your town, get an action shot of indoor sport or performance—hockey, skating, baskethall night basehall, aymphony or chorus leader in action, boxing, aesthetic danging etc. Strive for dramatic quality of natural light and for realism along with action and news interest. Rate the preture for both copy and content.
- 10 Attend a public auction, a class lecture by a colorful teacher whose personality has news interest a stage performance in which there is unusual dramatic action, or (with permission) the place of business of a prominent person. Take at least eight action shots for a picture sequence. Take these close enough to get dramatic facule effect with fast film and lens

Select at least three of the resulting prints, mount them for a news sequence Write a 40-60 unit overline and a 100-150 word underline Rate the sequence for both copy and content

## B CHAPTER ORGANIZING QUESTIONS

- 1 Suppose the municipal building in your town has started to burn, dangerously close to the picture deadline for the main edition of the paper on which you are employed as staff photographer. An outer wall starts falling with several firemen near it, one or more of whom will almost certainly be badly injured or killed. You have a motorcycle messenger with you Would you prefer a Speed Graphic for this assignment or a 36-exposure roll film small camera with a fast lens? Justity your answer.
- 2 Outline hypothetical situations which make four features important for a satisfactory news camera for general assignment work
- 3 Suppose you were covering the ecene of a sensational murder. Empty cartridge shells found at the scene and similar ahells in a room across the hall are available, and a scrawled note in the victim's hand, which suggests a motive. The murdered man was an architect who drew the plans for the palatial country bome in which he was killed while a guest. The façade of the house, showing a balcony from which police believe the murderer entered and departed, is an adaptation of an historic European palace to which the note clutched by the victim vaguely refers. What pictures would you take on this assignment? Could one camera be used for all of them? If not, why not? If so, how?
- 4 Assume you have been assumed as staff photographer to cover an important football game Explain by hypothetical scrimmage scenes why you would prefer not to do this with only a miniature camera. What dark room difficulties which might be encountered with 35-mm film would not fit into the practical demands of a newspaper office?
- 5 If a camera designer from a large manufacturer were to interview you for ideas as to how to improve newspaper cameras, what specific points would you suggest?
- 6 Suppose you are assigned to photograph a new municipal auditorium which is to be dedicated in a few weeks. The architectural plans were selected by international competition and exteriors and interiors both are unusual. You have induced the architect, a foreigner, in town for the day, to be present. He has a striking deeply lined face. You wish to get a close-up portrait of him. What sort of camera would you take along? What particular advantages would this camera possess?
- 7 What are the particular characteristics of the Rolleiflex? What limitations keep the Rolleiflex from having entirely replaced the Speed Graphic? For what particular kind of news photography is the Rolleiflex especially adapted?
- 8 What is the hest standard lens for defining power and general excellence? Would you ever buy for newspaper use second hand lenses? What kind of news pictures particularly call for what kind of filter? Why are filters not frequently used in news work?

- 9 What paper and ink limitations does newspaper reproduction present for obtaining contrast? A halftone reproduction recently made from a halftone printed in a magazine in 1894 resulted on enamel stock in a much brighter, clearer picture than the original halftone in the magazine. How could this be?
- 10 How is it possible to get more contrast into a newspaper reproduction from an old cabinet photograph than there is in the photograph itself? What is the purpose of occasional back lighting, or lighting a face from both sides, or high lighting the edges? What principle of tone value does this plasticate?

### CHAPTER VI

## THE STUDIO AND DARKROOM

#### PREVIEW QUERIES

After the manner of a motorear assembly line, a picture should methodically enter a darkroom as film in a holder and come out an enlarged dry print. For what nine procedures in this chain should a newspaper darkroom (or rooms) be equipped?

How may one guard against losses from variation in the temperature of water and air in a darkroom?

If speed demands that a negative be enlarged while still wet (as it usually does), what advantage has n horizontal enlarger over a vertical one? What advantages has the vertical enlarger?

What is the most commonly used developer in newspaper practice? For rotogravure prints or advertising pictures, where better detail or finer gradation is wanted, what developer is often used? What is the solution known as F 5?

If you wish to develop fast panchromatic films in a bright enough light to see your way around how may you prevent "fogging'?

If your negative on a hot day shows signs of wilting how can you stiffen it up?

Suppose you have an excellent picture on an overexposed or over developed negative or an excellent news shot on a thin negative with too little density. Is there anything you can do about it?

Which is hetter for news photography—glass plates, or cut film in holders? Why?

Suppose a reporter hrings in a horrowed group photograph which needs extensive retouching. The picture must be returned to the owner unmarred. All the city editor wants is one figure enlarged. How can the newspaper get a suitable engraving?

THE newspaper darkroom must have facilities for mixing drying of film, rapid drying of films, printing and enlarging from negatives, dry or wet, developing and washing prints, rapid drying of prints. The studio should be equipped to make portraits, still-life shots, or small groups, copy photography or drawings.

Reduced to its simplest and most mexpensive form, a plant capable of handling these requirements need consist only of a darkened closet with developing trays and tanks, a homemade enlarging machine, a sink near hy, an electric fan, perhaps, with an attached heater coil, film developing hangars, hottles for chemicals, and a few judiciously selected odds and ends. Such equipment might serve the small paper with one or two photographers. The equipment of the large metropolitan paper may run into thousands of dollars, although it still serves the same function.

The first and most useful additional expenditure is to allot separate working space for each different function. A chemical-mixing room should he the first function to claim separate space. Too many chemicals floating in the air—and they will, with the very greatest of ease—never promoted spotless negatives. A separate lahoratory for film loading and developing should be provided, one to each man where possible. Each operator then assumes individual responsibility for keeping his developer up to strength and the accidentally turned on light in the developing room happens less frequently. A man is less likely to go out on a bin with emitty film holders he thought were loaded.

One or more darkrooms should he provided for enlarging and printing Semi-automate print driers demand another few feet of minimum floor space They will dry and givo a high gloss to prints, in about 2 min cahinet will keep drit and dust off damp films as well as dry them quickly. The arrangement of the various darkrooms should he planned so that, just as on the automobile assembly line, work in process may go through the mill from one stage to the next with a minimum of footsteps. The film holder should go in at one end, so to speak, and a dry print come out at the other

Certain refinements suggest themselves which are luxury in a sense, but cannot be called useless investments, white tile walls which do not fog films hut allow the operator to move about unerringly, built in safelights and switches, automatic water-temperature controls, foot-pedal or knee-operated water outlets, air conditioning (a boon in hot weather, excellent cleanhness insurance, and a virtual necessity for color photography), any improvements of this type which the financial department will install are worth their price, to the photographers at least, in "streamlining" the work

Now for some details Darkrooms usually are equipped with sliding doors, making for compactness The individual film-

developing rooms, scarcely larger than a closet, contain a shelf for loading film holders and a sink with running water. The sink is generally of thick cypress wood, the most all-around efficient material for the price, it lasts indefinitely, acid will not ruin it, and it is lighter than slate. Developing tanks (usually of ruhher) rest in the sink or on a duckboard across it. Racks or hangars for holding the developing film hang above the loading shelf. A darkroom safelight may hang from a cord or rest on a shelf Ordinarily the films are washed in this same sink.

The enlarging room, always the scene of frantic activity as deadlines approach, should be large enough to allow at least two photographers to fall over each other A last minute 10h finds one man printing another at the sink, with maybe a city editor hanging desperately over the developing tray clamoring for speed while mentally cropping and captioning the print "cooking" in the "soup" A large sink with a duckboard supports the trave. and under it prints wash a hose running into the sink and a short standpipe draining the water A pendant safelight over the developing tray is a necessity Another one helps, an indirect light playing on the ceiling and illuminating the entire room The table or shelf on which the enlarger is mounted should have near at hand space for printing paper stock. This may be small calinets with doors from which the paper is pulled and the door sprung shut Usually, however, there are just the hoxes of paper lying on the table A foot treadle for the enlarging light gives the operator full use of both hands for dodging, and most news prints require some dodging

Enlargers may be divided into two types, horizontal and vertical A horizontal enlarger is oriented as a camera normally would be, the projected image heing on a vertical plane. The print size is changed by sliding the easel with the paper on it along a track or shelf toward or away from the lens of the camera. The vertical enlarger (Fig. 14) projects the image upon a horizontal table surface. As between the two there is little to choose for ordinary work. The space available, as well as personal preference, may dictate the type. However, an adequate horizontal machine can be constructed for less than a vertical one. Most news negatives must be printed while still wet, and unless properly held in a clip a wet negative sags more when lying flat than when standing vertically. Again, since heat can destroy a wet negative

in a very few seconds, a cool light source in the enlarger is a good safeguard. Many large plants employ the mercury vapor light, which burns "cold" and is intensely actinic. Inlargers equipped with automatic focusing cams save time. A fast lens, with good defining power, is an asset. The last place in the darkroom to

Photo by Harold Rhodenbaugh

Fig. 14—The vertical enlarger projects the picture upon a horizontal table surface. Space available may determine whether this or the horizontal enlarger is used.

save money is on the enlarger, one which is slightly out of kilter (off alignment) is worse than useless and a constant irritation

One of the most consistent darkroom troublemakers is varying water temperature (few plants boast automatic air or watertemperature control) In the winter water may be so cold that

<sup>1</sup>The new fluorescent mazda lamps may supersede the mercury vapor lamps. These new lamps emit a truly white light (6500° Kelvin) and are about as cool in operation as the mercury.

development cannot procede; and in the summer the emulsion ships off its gelatin support with very little provocation. In northern states the water from underground is usually not dangerously hot (say more than about 75°F.). The developing tranks are then left in the sinks with the water running around them; this makes a water jacket which prevents the solutions from rising to air temperature. Going south from Washington, D.C., the ground water is often too hot to use. The alternative of course is ice. Ice is awkward because the temperature is difficult to keep at all constant. So-called tropical processing methods may be resorted to in an emergency, but generally some cooling device is preferable. In cold weather solutions are kept in the air and heated occasionally by an electric immersion heater if they get chillfed.

Newspaper photographers, like their photographic brethren, do not all use exactly the same formulas, films, papers. Each plant will standardize on some one set of formulas and products. ulbeit in 6 months some of the "standardized" products will have been replaced by something newer. Someone, on a large staff, is always testing out a new speed gun, a new formula, a new kink of some sort. Manufacturers' representatives bring in samples of new products. In fact, if any large staff were to change none of its procedures it would suffer at the hands of rivals in two years' time, so rapid are the technical advances. Some of the advances, of course, are more funcied than real, but nevertheless the newspaper must from time to time try out new products and formulas (This is almost as true of equipment, although the financial problem enters here.) For these reasons it is useless here to go into extreme detail about the formulas and materials employed by papers. Only those will be mentioned which are in general ner

Because the simplest procedure, though not necessarily the best, is usually the quickest, new-paper darkrooms standardize on as few products and formulas as they ean coax into achieving the requisite results. It must be reiterated here that good results on the newspaper are measured in terms of beautiful salon prints. Many a good amateur, floundering in a maze of complex formulas and never-ending gadgets, stands dumfounded when he first sees the rough-and-tumble forthright procedure of the neverage news

darkroom He cannot feel that such hlunt simplicity gets results Perhaps it does not—the results be is striving for But it serves its purpose, and the news photographers, though they periodically damn their equipment, also swear by it

Every photographer knows D-72 It is a time-honored developing formula containing two obenical reducing agents, metol (clon to Eastman Kodak, just to he different) and hydroquinone. The pair make a versatile developer, so versatile that on most newspapers this developer, known to the amateur as a print developer, hecomes the universal solvent. It is around everywhere. It gets in your eyes and bair. Concentrated, which tends to produce contrastly results, it develops the gray day sports negatives diluted about 1 to 3 it develops most of the remaining negatives. Again concentrated it develops the prints of the sports negatives, diluted 1 to 4 and possibly primed with a dash of potassium bromide it makes an occasional exhibition print.

It is not a fine-grain developer, but you would never realize it when looking at the published photograph which was a ten diameter "blowup". New spapers occasionally keep stock solutions of special developers for unusual circumstances. Various standard formulas, published by Eastman and others, are available for the maximum-contrast developers, useful, for example, during the football season, when much gray-weather sport shoot ing must be done. Then a semifine-grain formula, such as D 76 is often used where better detail or finer gradation is wanted, for example in the rotogravure section or on the real estate or advertising pictures. Unless a newspaper runs through a great number of Leica or Contax films it is generally not worth the time or space to use other than ready-mixed developers for extreme fine-grain work.

Hypo—sodium thosulpbate to jou—the solution which removes the under eloped portion of the eraulson so that the film cannot go hlack, used to be made into solution alike for film and for paper. That is no longer true, owing to improvements in the formula for film use. Eastman calls it F-5. It contains a little hore acid, and there is no photographer who is not (or should not be) using it today.

Not much time is ordinarily available in the newspaper's rapid production schedule for fancy or complicated darkroom practices We need only mention desensitizing as a type of aid which, however, is seldom employed. Such an aid is useful at times—times when there is plenty of time. Desensitizing allows development of fast panchromatic films to be earried on in a bright yellow light, thus giving further control over individual negatives. Hypersensitizing with mercury to increase film speed has been used, as an occasional darkroom practice, although tentative tests tend to show that mercury hypersensitizing does not increase the speed of the very fastest films enough to warrant its use.

A few other points are worth mentioning. A little formaldehyde or potassium chrome alum will stiffen up a negative which shows signs of wilting on a hot day. Sometimes an alcohol andwater solution serves as a rinse to basten drying. A negative reducer—to thin down an overexposed or overdeveloped negative—usually consists of a handful of potassium ferricyamide and another of hypo in about a glass of water. This quick method of reducing negatives is frequently resorted to, as is also intensification, for building up density in thin negatives. Intensifier is most easily hought in ready-to-mix tubes and used only once.

How accurate must one he in the darkroom? Of course you are no more accurate than you must be when the deadline pushes your pulse, but how accurate must you he? Generally speaking it is wise to keep chemical quantities within about 10 per cent of the amounts specified. It is most important to do this with developers in order to insure consistent results and avoid catas tropbes. Anyhow, developers can he mixed quietly in advance of deadlines! One reason for using ready-mixed obermeals for intensification and the like is that it precludes any serious errors at crucial stages. And, of course, in bandling prints less discretion need be taken since another print is easier to make than another negative!

The student should know something about the films and papers which the newspaper uses An empurical statement is not much help, almost every conceivable brand is used at one time or another by at least a few plants. The best method is to know the qualifications required of the supplies for their job. In the first place let it be mentioned that, whereas glass plates were once universally used by the news fraternity, they are at present

almost entirely superseded by "cut film," an emulsion coated on a heavy celluloid base, loaded individually into film holders or adapted plate bolders, and handled while wet in metal racks which suspend the film in the developing tanks. Film is less hulky than plates, weighs less, and does not hreak

The panciromatic emulsion—sensitive to red—is now universally adopted by advanced papers and news services. The convert to panchromatic materials had to learn to handle his material either in total darkness, instead of with the familiar red safelight, or with a green light too dim to he of much help. He can, of course, desensitize the film just before or during the initial stages of development and develop in a yellow printing paper light.

Panchromatic emulsions were not widely used until recent years, but with improvements in the exposure latitude and in the speed of the emulsions, and possibly with the photographer's greater familiarity with the material, there came a wider use of it on newspapers. Ultimately of course it will be the only film used outside the studio or copying camera. Since mazda light emits a higher proportion of red rays than does ordinary sunlight, panchromatic films are indispensable for stage or indoor candid photography. The newest panchromatic films are superior to any former films in speed, brilliance, exposure latitude, and fineness of grain. They live up to their claims.

As between the film products of the several largest film manufacturers, there is probably little to choose At any one time, one manufacturer may have the ascendancy in having the fastest film, but he would not be able to hold such an advantage for many months The films of each will be reasonably consistent from hatch to hatch (there are always unavoidable variations in each hatch of emulsion cooked up), and always reliable The question is a matter of personal choice

In discussing the ments and qualifications of films, we have practically answered the matter of paper selection. The same tale holds true regarding the various products of the manufacturers and, harring exhaustive lahoratory test, the selection will depend upon personal preduction and last, but far from least, upon cost. Ohviously it may be found that some papers do not measure up to specific requirements, although usually each manufacturer does have some suitable paper. Some papers, in

hot weather, cannot withstand rough bandling or, more accurately, the consequences of too rapid fixation and drying on a bot belt dryer Some may not seem to produce good neb blacks except upon prolonged development, which will eliminate them from the burned darkroom

Darkrooms equipped with the powerful mercury vapor enlarging lights can afford to make enlargements with the slower chloride contact printing papers. Contact papers are not frequently used today although they have some advantages more rapid developing, cheaper cost, and one more grade of contrast available than the four obtainable on the fast bromide enlarging papers.

A word must be said about copying Every tenth print, more or less, which is used in the paper will be a photographic copy of another print, drawing, book reproduction, or what-have-you It may be recopied by the photo department for various reasons the original must be returned intact to the owner, the original is in a book which is ank ward for the engrave ro behald ein bis camera, much retouching is necessary which for any of the above reasons is madvisable upon the original, the size is wrong, either for the engraver who may need one small head enlarged ten times from a group photograph, or for the art department which may want a print to fit exactly into a pastedown layout. The last two reasons account for most of the copies.

In a large plant the net result is lots of copies Facilities must be reserved for this phase of the work and set to operate with a minimum of operations A copying camera is erected. It is generally a view camera mounted at a convenient height on a track which runs on a table or wall shelf. An easel supports the material to be copied. It may be only a board with thumbtacks, or it may be a glass-enclosed frame built to hold hooks, atlases, or worse. It need not approach the engraving camera in cost, accuracy, or complexity, although the general construction features might well be similar.

You can make a copy with almost any film—or with paper instead of film in a pinch (if you happen to have a reflecting enlarger around the house with which to print from paper negatives)—if the limitations of the material are known and it is handled accordingly Ordinarly, special-process or "com mercial" films (not quite so contrasty as process, but color-blind)

are used since they give brilliant results and can be easily bandled under a red safelight. A fast panehromatic film would have to he developed a longer time than these films to gain equal contrast or gamma.

Exposures for copying may be standardized, since the lights remain constant. It must be remembered however, when determining copying exposures, that an object which is photographed close to the camera requires longer exposures because the bellows must be further elongated, with the result that the lens aperture becomes relatively smaller than before. For example, an object copied to same size on the film will require an exposure exactly four times that which would ordinarily be required. Tables have been made for these data, although they are not particularly necessary in the newspaper plant and, anyhow, can be figured out from the data on lens openings, bellows extensions, and distance from object to lens.

## A APPLICATION EXERCISES

- 1 Assume that your paper in a town of 150 000 decides to get into the march of news photography, you, a reporter with camera expenses, have been assigned to plan a darknoom, two news cameramen and a darknoom apprentice will constitute the picture staff, a 10-foot square space in the room to be devoted to engraving can be spared Draw a floor plan showing what equipment you would recommend on an economical bass and how you would locate it for efficient use.
- Assume that after a year of successful picture experimentation your publisher tells you he will hire a third photographer and allow you a reasonable increase in derkroom space
   Indicate by floor plan or plans what you would do
- 3 Take at least three gray-day negatives Develop these with the proper concentration of D-72
- 4 Select what you consider an example of the best architecture in your city. Make three pictures of it for assumed use in a real estate section of a daily newspaper. Develop these prints yourself with a ready mixed developer suitable for getting good detail and gradation. Mount the best print you get and explain what developer you used

## B CHAPTER-ORGANIZING QUESTIONS

What darkroom arrangements and equipment would you recommend
to a publisher to secure speed in printing and to avoid dirt and dust on film?
 What kind of darkroom entrance will conserve space? What type of

2 What kind of darkroom entrance will conserve space? What type of water outlets in a darkroom are advisable? Of what material should the darkroom sink be constructed and why?

- 3 Suppose your homemade enlarger has been resulting in the destruction of wet negatives because of heat What change would you make?
- 4 If your darkroom practice requires a good deal of intensification, which would you prefer, ready-mixed chemicals or those which you mixed yourself?
- 5 What characteristic of panchromatic films makes certain precautionary measures in developing them necessary? What advantages do the newest panchromatic films have over former types?
- 6 Suppose a monument is to be erected in your city by the state historical society for an Indian chief whose effective friendliness to white settlers made the establishment of your city possible a generation earlier than otherwise would have been likely. Your city editor wants a 3-column cit of this Indian. The only picture available is a group halftone in a rare volume in the city library. The halftone, on a semi-enamel page of usual book size, shows at the Indian quite clearly as one of twelve Indians photographed at a powwow. Others in the group are undentified and unimportant. Explain bow you would get a assistatory pint for a 3 column cut of this Indian.

#### CHAPTER VII

## COVERING PICTURE ASSIGNMENTS

### PREVIEW QUERIES

Why, in general, would one expect a certain type of "great" news picture to come from amateur sources, and another type from professional news photographers? How would you classify, or distinguish between the two types?

Do news photographers often expose only a single sheet of film while out on assignment? Can you suggest a type of assignment on which

they might shoot but one negative?

In what ways is the photographic greenhom's task made easier when he works on an assignment with several other men? In what ways may his task seem to him more difficult under the same conditions?

Are there any reasonably satisfactory substitutes for a real apprenticeship for the amateur who wishes to become professionally capable, qualified?

Suggest two or three methods by which news photographers obtain ideas for "new and different" pictures

MANY of the greatest news pictures were made by amateurs. The picture of the sinking of the "Vestris," for example, was a famous amateur document of a cathstrophic event. The reason, of course, is that a news photographer cannot be assigned to a calamity in advance of the occurrence. Occasionally, as in the case of the Hindenburg explosion, the professional cameraman has been assigned to the "routine" news coveringe, and so happens to be on hand when the unexpected happens. And the professional's conduct in the face of an emergency bolds lessons for the amateur.

The Hindenburg explosion photograph shown in the frontispiece of this book was taken by Charles Hoff, staff photographer of *The Daily News*, New York. It was first prize in the spotnews class of New York's Press Photographers' show of members' work. In *The Daily News* of May 7, 1937, Hoff told the story of getting this picture as follows: We saw them throwing out the ropes and knew they were getting ready to moor the ship It was glistening up against the dark sky, and some one near me said "Do you knnw that a ship like that picks up seven tons of water in the rain?"

A smart guy, I thought Boh was nearhy I was practically under neath the mooring mast and I was shooting pictures every minute when,

-Bam!-it went up

Bob was down the line further, near where the Zep started to fall I was still shooting pictures So was Boh There it went An explosion like a hollow hoom, mayhe like an explosion of a firecracker in a mon strous empty can We saw the flames lick nut from near the tail, at a spot about a quarter of the way down from the rear

It started down Tail first Then another explosion This one was in the middle of the ship and the Hindenhurg went up like a large ball of

cotton waste dipped in flame

It wasn't coming down fast It looked more as if floating, drifting down like a fantastic burntout rocket shot up on the Fourth of July

It started doubling up as it fell I didn't think of the people on it as I watched I didn't think of the beautiful thing I had looked at a minute before I only tried to keep my hands from trembling as I slipped tha plates in

Sometimes the professional cameraman is on hand to photograph calamities But often it is a fast-thinking amateur who takes the only shots ever taken

Of course, the amateur photograph of a news event is generally inferior to that taken by the professional photographer. That is a reasonable assumption the news photographer practices his craft day in and day out, the amateur is relaxing occasionally with his hobby. However, it is pertinent for the student to inquire into the techniques and approaches employed by the newsman to present the recorded scene in its most forceful and storytelling manner, to extract the utmost meaning from a given scene

How does the professional go about actually getting his picture? How does he think through an assignment, what does he actually do on the joh, and why? These questions are not asked with equipment in mind, but in relation to the thoughts and techniques of the photographer on the joh We know what cameras he uses, and why he uses those he does, the problem now is to understand his method of evaluating in photographic terms the subject he must illustrate By why of introduction we may first mention

these points The newspaper photographer, like the eraftsman, draws heavily upon experience. This experience is a combination of various factors of learned motor reflexes, of habits of response, of manipulative skill of penetrating observation—this last is a "must", and of good old common sense. The degree to which each of these factors enters into the making of a picture varies of course with the photographer and with the occasion. Before elaborating further one or two hypothetical assignments may be followed through and from these we may derive as we go along a concept of the news photographer's hasic approach and of what theories govern his selection and arrangement of picture material

### AN ELEMENTARY ASSIGNMENT

Take first a simple assignment a college lays a cornerstone. The city editor sends the cameraman out to the scene, instructing him only to "cover it. If the photographer arrives late his camera will he open and adjusted, ready to shoot. If he is early, he will survey the scene gravitating toward the press agent or of one is lacking to the dais with its bigwigs. More often than not this type of event has its ubiquitous press representative alert for the newsmen. This makes life simpler, for the representative will know whom to photograph and will make the arrangements for posing. Nothing then remains for the cameraman except to await his time, although he may unobtrusively husy himself with candid shots of speakers or prominent (or picturesque) spectators (Fig. 15).

If there is no press agent, the cameraman sides quietly up to the center of activities and asks someone who appears authoritative but who is not at the moment engrossed, about the seating arrangement, who the important figures are, and other essential details he needs in order not to miss any important person or subject. If the photographer was too late for anything but just the picture his captions would be written later, sometimes not until the prints realied the city editor, who would, with the help of the photographer and others if necessary, fill in the names Needless to say this practice is frowned on in the hest circles Having worked his way into a good position, the cameraman makes himself inconspicuous and awaits the crux of the program

Now events of this nature, if they are used at all hy the paper, ordinarily do not warrant more than one picture. In this case

the storytelling picture, the gist of the whole affair, is the actual physical act of laying the cornerstone. So the photographer skips the speeches—except as mentioned above—and only cocks his gun when he senses action. He wants only one picture, he

Photo by John Mulls Jr

Fig. 15—The picturesque speaker or apectator is the news cameraman a natural quarry when he is covering an important event. Here Professor Albert Bushnell Hart was caught by reporters and photographer to

may take only one But if film is not running low he takes no chances—negatives have been lost, film spoiled, developers exhausted He takes a picture as the action gets under way He takes another for insurance Then he may change his location to obtain a different viewpoint. If he was down low in front of a platform, he may search a chair, a mound, a building, and

shoot again from an elevation The light may be varying, he shoots again to allow for this

The portion of a program of this nature which is of interest to the news photographer will have gone from start to completion as little time as it would take the old fashioned amateur (the one who did not have a range finder and speed gadgets) to focus his camera and expose one film, yet in that time our newsman will have half a dozen exposed plates under his belt. How did be work so fast? Perhaps you do not think he did, and not all professionals do, although most of them must work rapidly if they are to survive as newsmen. If you do not think be is fast try, if you are an amateur, to duplicate his performance and you will know.

He works fast for several reasons, two of them perfectly obvi-His is the experience of the man who repeats daily a series of operations which differ from occasion to occasion but are made up of the same mechanical actions He uses equipment built for speed. His mental approach is conducive to speed, through experience he has acquired mental work habits which exclude from the forefront of his consciousness all but a pantomimic impression of the action in which he is interested words, he is concentrating, somewhat as a cat would upon its prey, though in this case the sadistic element presumably would not enter the analogy-it might, of course, were the photographer stalking an unwilling subject! Although his thoughts are monopolized by this one center of activity, he has saved a corner of his eye for anything which may occur beyond the field of action, just as the cat probably reserves a measure of watchfulness for possible enemies

What the cameraman is watching through his finder is not President So-and-so laying the cornerstone for Such-and such building Those data have been registered in his mind and are, in a sense, lorgotten He now sees this pantonime which his eye, were he to analyze the matter, follows like some remote and detached activity on the planet Mars To him it is no longer a cornerstone laying, it is merely a sequence of action from which he will freeze static impressions. In other words, that part of bis conscious mind which is following the action is not thinking yes, this is no cornerstone, now they are laying it, and now I must shoot. That thought sequence came earlier and bas heen sub-

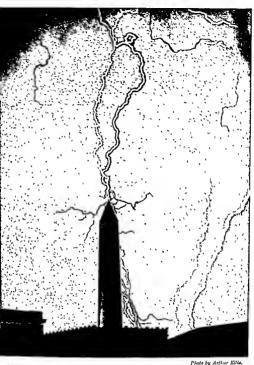

Fig. 16.—The news photographer has learned motor responses that function faster than bis conscious thought. That helps to explain this annating picture of lightning striking the Washington Monument. Weather pictures are always news.

merged so that as the cornerstone laying progresses he does not have to stop and think, this I must shoot, he just shoots, without thinking how or why! If he were suddenly interrupted and asked why he was shooting at that particular moment he prohably could not answer the question. As the actions unfold he knows instinctively—that is, without benefit of a complex train of logic—when to expose the film. In fact, he anticipates, so that at the correct moment his hand has squeezed the trigger without having received conscious orders to do so

Perhaps it is only necessary to say that the photographer is functioning rather like the automobile driver or airplane pilot. The pilot is continually called upon to meet new situations where his unconscious reactions—his learned motor responses, if you will—meet the problem more quickly than could conscious thought (Fig. 16). For although the problems may he new, they are composed of familiar elements in a new arrangement, and this arrangement will he competently dealt with helore the conscious mind has begun to study the problem.

Frequently in an assignment of the type exemplified by a cornerstone laying, the news photographer's task is rendered a little different by virtue of the fact that those laying the corner stone so desire publicity that they will reenact the scene for the photographer, in other words, pose for hun His problem is then simplified, it heing only necessary to pose the important person ages closely grouped around the cornerstone It is hoped that in shooting this kind of scene the cameraman may he able to avoid too posed and stiff an appearance, if he cannot direct the men to act naturally, the illustration suffers. There is less excuse for insisting on the stodgy posed picture reminiscent of the earliest days of news photography Aim first to get the scene-asit-actually-happened, then if the subjects wish it, or the photographer is not positive he has good material for the city desk, pose the scene and retake it for the benefit of posterity, closely simulating the actual event

When the photographer completes his pictures and has full captions, he returns to the office (or calls in, if he is hound elsewhere) From the developed negatives he will discard those with movement or poor exposure or those in which Mr So and-so cannot he seen behind Mr Nobody The remainder may he printed and, if he likes his prints, he may send them all to the city

editor for selection, or he may send down but one if it is clearly the best

This cornerstone example typifies a simple assignment can be seen it is so much an automatic routine that to the expenenced news photographer the assignment is second nature, he ought to be able to do it, and do it well, whether awake or asleep To the greenhorn the hurdle is high The reasons are chiefly mechanical Only actual repetitive practice gives assurance Many problems, psychological and photographic, pile up on the tyro to confuse him Just which man should be ask about the program arrangement? How does he spot the press representative? If the group is unfriendly toward the press, to what lengths can the photographer go in obtaining his picture? How much shoving about and ordering around is legitimate? If something obtrudes between the camera and the subject may one ask the President to move a little or to hold still? And what if his hat obscures his features? If the photographer does not eatch the picture at the requisite instant, may be ask for the pose to be held or repeated? Which of several points of view for the camera is the best?

This example is not meant to tell how to cover a cornerstone laying, or any similar job, individual conditions vary so much that this is impossible to do accurately. It does not profess to tell how any given photographer would go about the job. It is intended only to shed some light on what goes into the covering of an assignment, not what is done, but the approach to something done. In other words, it aims to show how the photographer's tools, experience, common sense, and intuition (his accumulated judgment) combine to produce his working method.

In cities the young photographer's problems are further increased by the presence of other cameramen. He has to squeeze his way into a buddle of toughened cameramen to get his picture, it may be difficult to get a satisfactory location. His elders will work faster than he, leaving bim with few or no pictures when they are finished. That may be emharrassing All these considerations eat up time with surprising alacrity, and the photographer out on his first job cannot neglect them.

Yet these problems are all trivial to the experienced man They are intensely real to the newhorn haby and there is obviously no categorical answer to them. They sprout up in new and changing forms, they differ with the assignment. They vary from moment to moment with the weather or dispositions of individuals. The only possible rule is to start with common sense harken to the voice of the elders, use smart judgment and hone for the best.

## THE APPROACH TO AN ADVANCE ASSICNMENT

Next may be considered an example of a little less simple charneter which may show the approach of the practiced photographer to a less conventional situation. In it will be attempted a further glumpse into his thought processes, subcon cious as well as conscious.

The corpus deheti is announced late one evening and the fragmentary reports from the police teletype indicate front pagnews. The photographer is reporter and a copy box shift into high with a destination in mind but no other facts. Arrived they seout around together to glean the elementary facts, location of body—who died how, when pox ible supports etc. With some groundwork to build on, they may part ways a porter after information, photographer after pictures. or necessity, to beat, or scoop his coworkers on the other morning This is an understandable and relatively honorable occupation even though it may involve subterfuge and possibly deception at the scene of activity Outrunning the other fellow on an assignment of this type becomes nn exciting game. A photographer will gleefully outwit his coworker by various quickly conceived stratagems. He will find nictures in hidden corners unthought of hy other men. He will clude unsym pathetic arms of the law to get his plates returned to the office He will be the first to obtain the picture frames contain ing portraits of the deceased, relatives, sweethcarts, etc these expedients he will resort to, and any more that come to an ingenious mind. He beats the other man at the game. How ever, he is not destructive about it—the game has their rules be might not offer his competitor a ride should the latter s car break down but on the other hand be does not slur his coworker into unconsciousness just to beat him back to the office, and he never steals or destroys the other fellow s film It is one thing to outwit your opponent in a came, quite another to place his job in recopardy or risk retaliation of a similar drastic kind on yourself!

Competitive activity may rule the day on a murder ease. Just as often as not, however, depending upon the particular circum stances, complete and trusting cooperation between some or all of the photographers will be the only possible means of extracting picture material from the scene. In this case a plan of attack will be mapped out by a group with a later interchange of the important negatives among the newspapers participating or prints will be sent by the owners of the negative to all other darkrooms.

As an example, one photographer may shoot scenes of no value in order to serve as a decoy, while another man undisturbed by meddlesome strangers or well wislung house servinits will get pretures of the important material. Again, one man may survey an interior scene, diverting suspicion from himself by not carrying a camera, so that later another man instructed in the lay of the land may get the picture before someone eatches him in the act. The advantages of collusion, in general, are great. The news photographer who wants to play the lone wolf must first make certain that he will be able to get his material and also be reason ably sure he can scoop his coworkers. Some picture is hetter than no picture, even if it is common property!

changing forms, they differ with the assignment. They vary from moment to moment, with the weather or dispositions of individuals. The only possible rule is to start with common sense, harken to the voice of the elders, use smart judgment, and hope for the best.

## THE APPROACH TO AN ADVANCE ASSIGNMENT

Next may be considered an example of a little less simple cbaracter which may show the approach of the practiced photographer to a less conventional situation. In it will be attempted a further glimpse into his thought processes, subconscious as well as conscious

The corpus delicti is announced late one evening and the frag mentary reports from the police teletype indicate front-page news The photographer, a reporter, and a copy boy shift into high with a destination in mind but no other facts Arrived, they scout around together to glean the elementary facts location of body—who died, how, when, possible suspects, etc With some groundwork to build on, they may part ways, reporter after information, photographer after pictures

If upon arrival the groundwork was self-evident, if there was a body in sight, the photographer's camera was in operation practically as he stepped from the ear. He had two or more negatives of the body as well as others of the immediate surroundings before be even stopped to think. This he did because the body is always in imminent danger of being moved away, the police or crowd of spectators may actively discourage pictures, everyone, press included, may be unceremoniously requested to vacate. If serious troubles seem to him to be pending, his copy boy is fast receding from the scene with the first few negatives hidden away. In this case the photographer shoots one plate as fast as another can be taken from the camera. He shoots—or better here, say photographs—the body, any weapons or clues, and surroundings.

Having spun through the prehiminanes, the photographer now checks with the reporter to go over any clues or information either may have He will also watch the clock, for assuming him to be on a morning paper, a deadline is threatening. So the copy boy may be sent hack to the office with the first negatives. Another factor may complicate the cameraman's technique, the desire.

or necessity, to beat, or scoop his coworkers on the other morning This is an understandable and relatively honorable occupation even though it may involve subterfuge and possibly deception at the scene of activity Outrunning the other fellow on an assignment of this type becomes an exciting game. A photographer will gleefully outwit his coworker by various quickly conceived stratagems. He will find pictures in hidden corners unthought of by other men. He will clude unsym nathetic arms of the law to get his plates returned to the office safely. He will be the first to obtain the picture frames contain ing portraits of the deceased, relatives sweethearts, etc. All these expedients he will resort to, and any more that come to an ingenious mind. He beats the other man at the game. How ever, he is not destructive about it-the gaine has taeit rules he might not offer his competitor a ride should the latter s ear break down, but on the other hand he does not slug his coworker into unconsciousness just to beat him back to the office and he never steals or destroys the other fellow's film It is one thing to out wit your opponent in a game, quite another to place his job in leonardy or risk retaliation of a similar drastic kind on yourself! Competitive activity may rule the day on a murder case. Just

Competitive activity may rule the day on a mirder ease. Just as often as not, however, depending upon the particular circum stances, complete and trusting cooperation between some or all of the photographers will be the only possible means of extracting neutrer maternal from the scene. In this case a plan of attack will be mapped out by a group with n later interchange of the important negatives among the newspapers participating or prints will be sent by the owners of the necessive to all other darkrooms!

As an example, one photographer may shoot scene- of no value in order to serve as a decoy, while another man undisturbed by meddlesome strangers or well welming house servants will get pictures of the important material. Again, one man may survey an interior scene diverting suspicion from himself by not entrying a camera so that later another man instructed in the lay of the land may get the picture before someone eatches him in the act. The advantages of collusion, in general, are great. The news photographer who wants to play the lone wolf must first make certain that he will be able to get his material and also be reason ably sure be can secoph his coveriers. Some picture is better than no picture, even if it is common property!

It will not further the real purpose of this chapter to delve more into our hypothetical murder. We might present endless variations in the murder seene and for each of them indicate the probable course of action a news photographer would take. Answers to specific situations, however, are not within the province of on short chapter on covering picture assignments, nor do nny more than a few typical answers solve the fundamental hows and whys of the news photographer s approach. Hence we shall leave the murder to the experienced man—the novice will not get one, unless he indone so no call—and now inquire how the beginner goes about getting a working approach which will enable him to cope with the unlimited variety of situations he will inevitably encounter.

Ingeniousness and resourcefulness of course count heavily in facing new situations Obvious also is familiarity with equipment and manipulative tecliniques-complete, automatic famili arity We have already mentioned experience. It is of course a sine qua non Apprenticeship is the hest form of experience for the news photographer Lacking it, the student may have recourse to observation of actual news pictures Much may be learned in this manner, and even more if the student actually tries his own hand at covering an assignment of the "feature" type Almost any local event will serve as a good practice ground for the student Such things as county fairs, the circus. the high school s home-coming game, amateur theatricals, hencfit teas, outings, children's camps, track meets, cornhusking, beauty contests-the list is merhaustible. Those who do not own synchro-flash outfits will spare themselves much irritation and discouragement if they confine their practice work to outdoor events, the wrong equipment never makes operations easier, least of all the amateur's!

Now, if possible, the student should combine the observation of specific feature news prefures with expression after enough general photographic practice to gain some self assurance, be should procure a set of pretures of some local event, and then compare the results with any pictures of the same event published in the local papers. After a few attempts of this sort, the student will he prepared to examine professional pictures with a critical eye and be able to gain much more from their study than if he had never attempted anything himself. He will learn to search

for the pitfalls he himself might have stumbled into: he will understand why the news photographer chose one viewpoint rather than another possible one, why he recorded the action at

Fig 17 -First aid for a near victim of drowning. The best newsphotos are those that "tell their story ' at a glance

some particular stage. This method of self-instruction, this training in simultaneous observation of the recorded picture and the event itself, will give the student a hetter understanding of the approaches to news photography than any series of expository examples.

Perusal of newspapers, of news stones as well as pictures will give the student an increasing understanding of "newsworthiness" A better grasp of this value—the content of newsphotographs discussed in Chapter II-will make, obviously, a more competent photographer This ability to evaluate the events of life in terms of news value can of course, be learned Nevertheless it is undoubtedly true that the greatest newspapermen come by their "nose for news" instinctively The news photographer who consistently turns in pictures with a punch-the pictures which need no caption but tell the whole story at a glance-may have studied rules but he has in addition to experience a special way of looking at things (Fig. 17) Not only was his eye trained to look for significant points of view, visual counterparts of the reporter's who where when why, how, but he has a naturally curious nature, he has an inborn visual inquisitiveness a natural tendency to judge news value correctly How he came by these traits is another story, in part they must be the result of what values the person has been exposed to throughout youth These traits, however, are an asset, and a great one

### IN THE COURTROOM

In the light of this discussion, we may glance briefly at one or two more examples of a slightly different character. We may now trace our murder to the courtroom, although we shall not necessarily assume for purposes of illustration that it is actually still a murder thal. Few assignments require more patience and resourcefulness than court thials. Only one photographer at a time may be allowed in the courtroom. Pictures may have to be grabbed surreptitiously with miniature cameras. Court attendants may be unfriendly. The prisoner, or defendants may resent publicity, dodging photographers, hiding behind people and posts Scidom is it possible to predict entrances and exits of important claimaters.

Difficulties unanticipated arise to confound the photographers and reporters. Artfully planned group cooperation becomes a necessity. Thus, if a witness leaves the stand determined not to be photographed, a line of photographers may get the picture, the first camera in the path shoots off a flash whereupon the unsuspecting witness uncovers only to be confronted with unother camera upon the line of march. Experience and careful thought

suggest the expedients necessary to overcome the obstacles peculiar to each circumstance. Not only must the photographer either follow the trial carefully himself or have frequent consultations with reporters, but he must also learn to judge accurately the luman equations. How much picture snapping will the judge

Fig. 18—An eye for humor helps the news photographer make an arresting ahot out of an otherwise sordid situation

tolerate? The sergeant-at-arms? Can the cameraman play the game alone, or would be be wiser to work with other cameramen? Will one forbidden flash hulh blown off in the courtroom spoil all further chances for cameramen?

The cameraman must want hours for a witness to leave the court, grab his pictures on the run (literally!), and then he sure he has "mugged" the right person. And was that an important

person to shoot in the first place? There are no hard and fast rules to cover contingencies of this type, next to experience, the most helpful qualities are ingenuity, patience, and humor mingled with alertness, a certain amount of aggressiveness, and acute observation of people, their actions and behavior (Fig. 18). The newcomer usually will find some brother in the tribe willing to belo him over the rough spots.

The point raised here again is the same old one. You cannot teach a man hou to cover this or that assignment, you can only make him think about the type of problems raised by an assignment.

### FEATURE PICTURES

The origins and types of feature pictures are discussed fully in Chapter III, this section will merely deal hriefly with one or two examples showing how to go about taking them pictures demand, perhaps above all others, the open and inquiring point of view When, on a dull Sunday, the city desk suggests that the cameraman go forth and procure material-something, anything-to enliven Monday's paper, it is up to the photog rapher to he his most resourceful Perhaps the assignment, as is often the case, calls for a hatch of pictures on "hot weather" or "cold weather" (Fig 16) Well, say it is hot Off the photographer goes, looking for a group of pictures to illustrate oppressive heat He may proceed in this fashion. He checks down the obvious listing little girls eating ice-cream cones, children taking hose haths, people asleep in the shade, etc. down the whole list of timeworn material Some of these subjects he will of course hring back to the editor, one cannot invariably he original about so common a subject However, a new treatment of an old theme is always refreshing a different face, with an appealing expression operating on the ice-cream cone, is not scorned Perhaps a new form of ice-cream followon or frozen we has just been introduced, then such a variation on the theme is worth while

The photographer, as he goes from park to city street, from swimming pool to farmhouse, will he on the alert for new ideas If he notes a horse drinking, he may shoot a close-up of it, not having recalled any such scene in the papers during former heat waves The beads of sweat on his own brow may suggest a close-up of just that, using a fat passer-by to lend humor to the picture. Or it might suggest a close-up of a man's hand running a handkerchief around bis collar. One possibility the writer has noted, but never seen used, was a gift-shop show window, with candles drooping and hent double from the heat. One thing seen and another thought of—each new idea bears the germ of another. In two hours' time the eameraman will return with a group of pictures from which the city desk may select a reasonable number of conventional views with a sprinkling of new ideas to intrigue the reader.

The point of the hrief example just given is that keen observation plays a large part in the creation of new or different fracture pictures. Many "different" pictures are the direct result of seeing some new subject matter, while others are the result of a train of thought, in which one thing seen suggests a kindred thing unseen but possible of arrangement.

Mention should also be made of another type of feature picture complete photographic coverage of some scene, event, industry, social event, or geographic area, doing for new spaper presentation something a little like what recently has been dubbed the "photographic essay " The approach to an assignment of this type may be outlined as follows First, when conditions permit, the photographer should obtain at first hand a general conception of all the possible picture scenes Thus, if it be a large bread hakery, he should follow the process through from the arrival of the raw flour to the packaging and delivery of the product, or if he were assigned to a picture story of an army fort, a hrief inspection tour of the grounds with someone in authority would serve to give him an indication of the photographic material Such tours enable the photographer to examine selectively all picture possibilities. He should take mental notes on what he feels would give the most vivid and graphic presentation of the material Some photographers will visualize as a group the exact number of pictures they intend to make, others may simply survey the scene to ohtain a feeling for it, and then proceed to shoot everything that interests them as they go over the territory with a camera Either method is good, in both the cameraman senses the salient photographic features and attempts to bring them out, to make each picture a simple, dramatic presentation of one unit in the whole In other words, the pictures should be

considered, to use a literary analogy, not principally as separate epigrams, but as paragraphs or chapters which cohere to make a single purposeful essay

# COMPOSITION IN NEWS PICTURE TAKING

Here is a word about what is called composition, or design—the arrangement of the lines and tones in a picture to make a harmonious, agreeable, or dramatic appeal to the eye. The straight news shot may or may not have what the academicians are pleased to call composition. If it has composition, then that must generally he the result of accident since one cannot do much arranging of lighting and subject matter with spot news events. Feature pictures allow the photographer some choice. If he confines his picture to one and only one subject or idea, then he has gone some distance toward achieving this intangible quality.

quality

There are several good hooks dealing exhaustively with composition

Observation of good photographs and paintings is an unsurpassed training for the development of a critical eye

### A APPLICATION EXERCISES

- 1 Assume, for the sake of an elementary lesson, that some simple bouse-bold event occurring in the home of friends in newworthy. The baby's birthday, purchase of a new automobile, redecoration of the house, win ning of a track event by the young son, an afternoon tea, the bomecoming from school of a daughter—use some event of this type (If you are not equipped adequately for interior photography, do not attempt it? Take your camers and cover such an event exactly as you feel it should be covered by a professional news photographer. Do not shirk your job because it is among friends bear in mind the news slait and make a professional job of it. Listen to criticism from friends about it, or, if possible, from some newspaper acquandance if no instructor is available.
- 2 Select one of the following picture possibilities and turn in three "shots" autable for publication in your local paper a local arnateur theat-rical performance, a high school sports event, a luncheon club outing, a public concert, ground breaking or progress on a new building. Use if possible an event in which you have at least a few personal friends, your success will be measured in part by the degree of their interest in obtain ing prints!
- 3 The amateur who feels himself thoroughly grounded in elementary techniques should search for a larger stamping ground O'btain directly from your local newspaper, or from the city desk, a list of forthcoming events of some local importance—avoiding ones to which you do not feel you will be able to gain admission of course—and attend one or two with

camera in hand Do not worry too much about actually shooting pictures, but observe carefully the actions of the news photographers on the job and compare what you think you would shoot with what they actually do shoot

- 4. Attend some other similar town event, whether a husking bee, a church dedication, an important wedding, an athletic event, or the opening of a new factory—any thing which can be scheduled in advance—and cover it with your camen. Submit the pictures to your instructor for criticism
- 5 Search through the news columns of your paper for a week or more, until you find some little news note which you field would have interest to the local populace if it were presented more fully as a group of feature pictures or if the story behind the news were dug up by yourself and presented as a photographic essay. Prepare six to be used as a feature page. Study them to see if you feel you have actually put across an idea.
- 6 Originate entirely from your own mind, by means of actual observation or thought without reference to the news columns, a feature idea Photograph is and turn the photograph in
- 7 Secure from the local Red Cross, chanty organization, or similar institution, a definite assignment to present their cause and activities to the public. To to do this on a commercial basis if that is feasible.

# B CHAPTER-ORGANIZING QUESTIONS

- 1 It is impossible to enumerate all the possible situations and problems which may confront the news photographer as he explores life's vagaries. New situations arise continually, and one can only be instructed in them on the basis of past experience. In the light of your own study and experience, construct in detail a mental picture of how you would go shout covering some spot news event about which you have recently read in the papers Indicate your precise reasons for describing the approach you used
- 2 Write an essay of not more than 300 words in which you describe cogently and succinctly what you believe to be the qualities with which a good news photographer should be influed. If you feel there are any analogies between the qualities required of a photographer and those required by some other callines, indicate them.
- 3 Enumerate a series of do's and don'ts for the news photographer Try to put them into general rather than specific terms, in other words, set them up as rules, rather than descriptions of particular little things which photographers may have done at some past time. Your list should compass between 6 and 25 stems. Add as many of your own origin as you can think up, and ask the instructor to comment upon them.
- 4 Secure from a library a book on composition, for example, H R Poore's work, making notes of those portions which you feel might have some direct bearing upon pews feature work.

#### CHAPTER VIII

# PHOTO EQUIPMENT FOR LARGE AND SMALL NEWSPAPERS

# PREVIEW QUERIES

For immediate use and to build for future possibilities, what specific news photography equipment would you order for the general locker of the picture department? For each cameraman's individual locker?

Is flashlight powder still used in newspaper practice?

As larger sports arenas and vaster auditoriums have been built, press boxes are farther from playing fields or speakers' stands. What changes in lens equipment have newspapers adopted to meet this condition?

For what do newspapers use the "Magic Lyo" camera?

What should the studio room of a newspaper contain?

What equipment should the advertising department's photographers have?

For interior general views, where a fissh bulb will not give sufficient light, what device is used by newspaper photographers?

PHOTO equipment varies with the newspaper and with the importance attached to pictorial news coverage. Budget and circulation affect the amount of material purchased. In any discussion of equipment needs it must be borne in mind that many papers are still as badly off in this respect as they are understaffed in cameramen and others capable of handling newspapers. A newspaper may add to its supply of equipment gradually, but in doing so it should be building toward a future when its photographic studie will be adequate to the growing demand for picture reporting.

In this chapter we shall describe what would probably be found in the camera lockers of an up-to-date and picture-conscious newspaper with a circulation of 125,000, in a city of some 500,000 inhabitants. We shall assume that this "model" paper has n Sunday edition and nlso the opposition of at least one competitor in its direct daily field. This model paper will have a chief photographer, five news cameramen, and a darkroom boy or apprentice to comprise its staff for the pictorial coverage of news and sports assignments. In describing the photo equipment of such a paper, the intention is not to urge that this is what is needed by every newspaper plant, but merely to provide a enterion by which executives may judge what their own paper requires. This will be different in each particular case.

The camera which has been accepted as standard in the United States and which will be found in use in nearly every newspaper or photo service is the Speed Graphic Until recently the 4 by 5 Graphic was the standard size in use, but some have changed to the new 3½ by 4½ size

Each cameraman should have a locker of his own in which to keep his equipment This would probably contain the following

Speed Graphic with photoflash bulb synchronizer

Tripod

Powder flash gun and powder supply (Yes powder is still used for night shots where a large area is to be illuminated)

1 doz film plateholders

Supply of photofiash bulbs and negative material

Additional locker space should also be provided for extra clothing such as boots, raincoats, etc

## GENERAL LOCKER

There should be a general locker to keep the following special equipment

- 2 candid cameras of the Leica or Contax types with one or more supplementary lenses and developing equipment
  - 2 12-in telephoto lenses mounted on lensboards to fit a Speed Graphic
  - 1 4 by 5 Graffex with 834 or 834 in f/4 5 lens and a 17 in telephoto, f/4 5
  - 1 "Big Bertha" type Iens mounted on a 5 by 7 Graflex The focal length of this Iens may vary from 20 to 28 m, depending on the size of the sports stadia or baseball parks in which this equipment will most likely be used
  - 1 'Magic Eye 35 mm camera with supplementary lenses of about 6-in focal length and a fast wide angle
  - 1 10-in f/3 5 lens to be mounted on lens board to fit the 4 by 5 Graffex

2 photoflash bulb guns designed for firing three or more bulbs simul taneously for interior general views

1 f/2 7 or 2 9 lens of 6 or 61/2 m focal length

The use of candid cameras will depend on just how much the management of the paper cares for this type of art. At present there is a division between those who use these cameras as regular equipment and those who use them only for special effects or to obtain shots in places where regular news equipment is barred, as in courtrooms

The 12-in telephoto lenses for the Graphics will pay for them selves many times over during floods inver rescues, political campagns, etc. They are light require little space in the photographer's bag, and can be slipped into position in as little time as it takes to change a lens board.

The 10-in  $\tilde{f}/3$  5 lens is intended for use on the 4 by 5 Graflex on sports events on dark days when it is necessary to use the shutter at high speeds in order to stop action yet get a good exposure. The 10 in length is suggested because it is a handy length for tenns or football from the aide lines and provides a lens to balance the assortment for the 4 by 5 Graflex. The 4 by 5 Graflex with 8/2 and 17 in lenses will prove an ideal combination for sports work and for news assignments which might call for lenses of that length. It is light and therefore much more mobile than the "Big Bertha," which must be kept nearly in one spot on an assignment

There was a time not long ago when a 20 m lens mounted m "Big Bertha" style was considered an unusually large outfit, and the photographer who carned it was the object of much staring and questioning on the part of bystanders Today a 20 m lens is no longer regarded as particularly "long". Its place has been taken over by 28 m lenses, and some of the 40-m type are beginning to be used regularly. The 40 m lenses have a himted usage however, for as yet they have not been manufactured in a faster lens speed than f/S, which requires fairly good light in order to get a well-exposed negative at high shutter speeds. This growth in focal length is accounted for hy the demand of editors for large images and by the fact that the new sports arenas and auditoriums are being built much larger to accommodate greater capacities, so that the photo press boxes are farther from the playing fields or speakers' stands than formerly

The "Magic Lye" camera is used to make a strip of continuous It is merely a hand held movie enmera, using film of standard size (35 mm ) the shutter of which has been armized so that a nrious speeds can be obtained by regulating the size of the shutter openings. Some newspapers have had stronger surings or different genr ratio inserted in the motor mechanism in order to get more frames per second, while others have had the springs or cear ratio showed to half speed to keep from using the much In either exent, the frames must be closely edited after development and the proper ones maked to obtain the desired continuity in the strip

The 1/27 or 29 lens will be usable only on special necasinus such as boxing matches, where the u e of flash bulbs is barred In some instances where this type of enverage on fights is com-

pulsors you will probably find f/1 8 or 1 9 lenses

Of course a good conv stand with shaded lights on extension arms which may be placed in varied positions and a copy camers with some free-moving sturdy supporting arrangement are al o

necessars for the well-compared new-paper

A studio roum should be provided. Its size and the elaborateness of its equipment will depend on the innount of use in which it is put. It will be used for portraits and small graups by the news cameramen and by the advertising staff for photographing their special setups of shors silvernare glassware etc. which could not be photographed at the store of the advertiser because of lack of facilities The equipment for this studio room will be phont as follows

A studio camera prolably an S by 10 with a 5 by 7 reducing tack A good studio lighting unit including general illumination and at least one spothight

A neutral background

A tilting reflector and screen A bench and tal le

A dressing tal le with mirror

runpment for the ndvertising department plinto stuff should consist of

<sup>2</sup> view cameras one probably 5 by 7 and the other either 5 by 7 or 4 by 5

Wide-angle lenses for the above as well as lenses of medium focal lengths and filters

2 sturdy tripods

A Speed Graphic with speed gun, for covering advertising news pictures and promotion work

A good set of portable lights for interior shots

#### DARKROOM FORIPMENT

The equipment for the darkroom where the negatives are developed and printed will vary more in different newspaper shops than the equipment for the exposing of the negatives, for the simple reason that only in recent years has a complete enlarging machine suitable for news work been available homemade or assembled enlargers which have been in use for years are often still doing service, since they are stationary and usually have a long life The horizontal enlarger has given way to some extent to the vertical enlarger, which gained in popularity principally because it saved space (Fig 14) Somo of these vertical machines are autofocus while others must be operated manually One of the most practical for newspaper use is the old horizontal type camera mounted vertically with counterweights arranged to take up the weight for focusing Regardless of the type of enlargers, the news staff should have free access to one or two of these machines at all times, and the advertising photo staff should have one for their exclusive use

There are probably some who still enlarge on chloride paper, but the bulk of the news printing is done on bromide paper, which is made particularly for that purpose

No more than two photographers should be assigned to a developing room in order to have that room accessible when it is needed. One of the most important features of these developing rooms should be provision of hot and cold running water. Temperature control is one of the most important factors in successful negative development, and the photographer must have some means of cooling or warming his chemicals according to the seasons of the year and room temperature. A separate chemical-mixing room should also he provided in order to keep the developing rooms free from chemical dust.

All the equipment mentioned would amount to thousands of dollars, it is true, but such equipment will have a long life

Lenses last for years, they never wear out and are seldom broken The Speed Graphics, because they are subjected to every concereable hand of weather and rough treatment in the course of news work, will need to be replaced every several years Proba bly the same lens can be used through the life of several cameras

In the last analysis each newspaper must decide its own require-The newspaper plant which invests in the latest types of composing room and press-room machiners will also want to be a jump ahead of its competitors in equipment for pictorial coverage of the news and pictorial service to its advertisers

The following is a possible selection of equipment for small town-newspaper darkroom, 1 e. a town of about 50,000, with one to five men in the photo department. Each cameraman should he supplied with

Speed Graphic with photofiash hulb synchronizer

Tripod

The usual accessories such as carrying case, a vellow and/or red filter. lens hood, focusing cloth, etc

A wide-angle lens is a convenient extra item.

Money may be sayed by having a Graphic only for each cameraman actually at work, although it is not advisable in case of emergency assignments requiring all men to come in and work

A general locker should include

Powder flash gun and powder supply

1 Leica or Contax with f/I 5 lens For the miniature camera if possible, a wide-angle lens and 1 fast

telephoto lens, optional 1 Graflex with 10-in f/3 5 lens for covering sports

Where it is not deemed advisable to purchase this much equipment, a fast 12-in telephoto lens fitted for the Graphics will serve to cover sports events

For the studio and advertising and copying departments, one 4 by 5 or 5 hy 7 view camera is adequate It should be provided with a fairly solid tripod, the portable commercial kind which has a center rising post. It should have an f/6 8 or f/8 lens of good definition, one element of which can be used alone to give a long-focus lens, a wide-angle lens, and one or two filters for outdoor architectural work One spotlight should be supplied for

the studio and about four portable aluminum reflectors with lightweight stands

#### A APPLICATION EXERCISES

- 1 Assume that the equipment suggested in this chapter for one individual cameraman's locker would cost approximately \$200, that usggested for the general locker approximately \$1800, that of this equipment a Speed Grapbic with photoflash bulb synchronizer costs approximately \$110, a "Big Berths, \$350 Remember that photographic investment will depend unpor tantly upon the prosperity of the paper, competition, and picture possibilities in the paper a rare. Select a city of about 150 000 with the newspaper and news conditions of which you are reasonably familiar. As a hypothetical recommendation to a publisher in this city, list equipment which would cost approximately half the total assumed for the enterior succession in this chapter.
- 2 Suppose you had for advertusing and promotion purposes a view camera with suitable lenses a Speed Graphic with guin, a set of portable lights and a tripod List five specific advertising pictures in your college town which might be used in a Home-coming Edition 'List five which might be used in a midsummer special edition to try to stimulate the 'summer slump. Explain what equipment you would use for each picture
- 3 Assume you had a study at the newspaper plant equipped as suggested in this chapter List five specific hypothetical pictures of different types which would normally be taken in the study.

## B CHAPTER ORGANIZING QUESTIONS

- I Describe two specific pictures a news photographer might be assigned to take which would make flashlight powder advisable. Describe two in the taking of which the firing of three or more flash bulbs simultaneously would be describe.
- 2 Describe two specific pictures for which 12 in telephoto lenses would be indicated. What picture situation would call for a "Big Bertha" lens of 20 to 28 in focal length?
- 3 Suppose you were assigned to get action pictures of a football game on a dark day What lens would you take from the general locker? Would you take a 40-in lens on this assignment? Justify your answer.
- 4 Suppose the army equestron jumping team which recently had been selected to compete in the Olympic Games was to exhibit in a horse show in your cit). What equipment would you take to get shots of horses and ridors approaching cleaning, and landing? Why would cireful editing of these negative she necessar?
- 5 Why are separate chemical mixing rooms advisable? Why is it better not to load film bolders in the developing or printing room?

## CHAPTER IX

#### ART-DEPARTMENT PRACTICE

## PREVIEW OUTRIES

In handling many pictures for each edition of a newspaper, how do editors keep the cuts from getting into the wrong edition or on the wrong page without sending detailed instructions or without following them to the makeup atones?

If the print of a picture has unessential details besides the figures in action of high news value, how does an editor give the news value maximum size in the allotted space, at the same time eliminating most or all of the unimportant parts of the print?

How may instructions be written on the back of a print, or marks be put upon the face, without their showing through or without marring the picture for future use?

Only one dimension of a picture may be controlled in reducing or enlarging. If a cut 6 in wide is made from an 8 by 10 print, the depth will unavoidably be in exact proportion to the ratio of reduced width Therefore, how may an edutor tell almost instantly what the exact dimensions of a cut will be.

Is it possible to give a picture the precise amount of space its news value might suggest? What mechanical objection might there be to printing in a newspaper a 3-column cut of the Duchess of Windsor walking?

What kind of pictures should be retouched?

If a poor print of good news value contains a profile so lacking sharp outline that it would fade out in the halftone, what can be done to reproduce it satisfactorily?

If a picture contains too much confusing detail in the midst of which are news figures in action, how may the objectionable detail be obliterated?

AFTER a selection has been made of the newsphotos which are to be reproduced in the paper, each print is given special attention before it is passed on to the engraving plant. If it is perfect copy and if the whole of the picture is to be reproduced in the halftone, then all it will need is to have instructions for the engraver attached to it, indicating what size of cut is required and for which edition and section of the paper the cut is to be used. So that the cut may not go astray the picture will also bear a

"slug" or word by which, together with the halftone, it may be identified in transit through the art department, the engraving plant, and the composing room, where it must find its place in the proper page. This slug will likewise he written into the page dummy, in the place where the picture is to go, and will serve as a guide to the makeup man, who assembles type and halftones and arranges them in the page forms.

Thus a picture of Miss Alice Martin making her debut at a fashionable reception, to be used on the Wednesday society page, as a 3 column cut, may earry the notation "Deb—Wed Soc—3 col" Or a picture of a local theater fire for the City edition of the daily would be marked, "Fire—City" Having used a slug word once, the picture editor is carful not to repeat it, another fire picture might be slugged "Flame" or another photograph of a debutante "Jones" for the name of the girl

If the picture editor does not wish the entire photograph to appear in the final cut or halftone, he indicates by cropping just how much he wants. There are a number of practices concerning the placing of "crop marks" on pictures to indicato the area to he reproduced. Usually, newsphotos have a small white margin, and cutoff marks placed here will show the engraver clearly what he is to include.

Some editors hold their glossy print to the light and indicate with light pencil marks on the back, just how they wish it cropped Art departments may be equipped with a glass plate lighted from below by an electric hulb, over which they place the photo face down to crop it in this manner. There is one danger in this method of cropping, and that is that the lines, if made with a hard pencil, will cause a raised surface on the front of the print, which would show if at some later time it was desired to reproduce a larger area of the picture. Writing instructions to the engraver on the hack of the print may likewise deface it. When such instructions and crop marks are placed on the back of the print, they should be done with a soft pencil, with care not to indent the paner.

Many offices prefer to avoid this chance of damaging the picture, by putting crop marks and instructions on a sheet of transparent paper—a frisket—pasted to the hack of the picture along the top edge and folded down over its face. The picture

can be seen through this sheet, and light pencil lines are drawn to indicate the area to be used. Even here, care must be taken not to press the pencil into the face of the picture

When full lines forming a frame are drawn on the front of the picture itself to show how it is to be cropped, they may destroy it for future use. This method also has the disadvantage that, if the lines are not at perfect right angles, the resulting cut will not be true in shape. Experienced art-department workers often do put short crop marks directly on the face of the photo, but they do so with a lithograph penel or white water soluble paint and a hrush stroke. After the engraver has finished with the print these marks can be wiped off with a hit of moist cotton, leaving no trace.

Photos are cropped for a vanety of reasons

- 1 The editor may feel that the action, drama, or reader appeal is found in a small section of the print and that the other portions are without interest. He crops it down to this vital part, which he can then enlarge to the full size of the space he has available on the page.
- 2 He may he able to allot only a small space to the halftone and therefore prefers to erop as much as possible, remembering that, if he does not do so, the whole picture must be reduced to the required size
- 3 It may be necessary to crop the picture to some shape other than a rectangle, so that it may fit into a layout in combination with other photos. A corner which has no detail or interest may be cropped out to give a spot for type. Such a cropping out of a corner or portion of the rectangular print is termed a "mortise" Sometimes the mortise is in the form of a box or rectangle on the hody of the picture. The resulting cut has a square hole, into which the printer fits the cutline type, which bears the description of the meture.
- 4 Fancy cropping as a method of ornamenting the picture is still seen, but is not considered the best practice today. A news photo has a story to tell, a message to convey. It should do so as simply as possible, and does not need a scalloped or wave-line edge to add to its effectiveness. Where such cropping is still practiced, it is accomplished by brush strokes of solible white paint. It is, however, a practice to be discouraged.

In ordering cuts, the newspaper column serves as a measure Thus, the instructions to the engraver may call for a 1-column cut, a 3-column cut, a 3-column cut, a 6-column layout, etc Cuts made the width of the newspaper column or in multiples of that width simplify makeup in the composing room, but odd sizes may be indicated by the exact dimensions required, in inches or in picas

The term "3 column cut" refers to a metal halftone which is 36 picas, or 6 in in width (6 picas = 1 in ) If the area of the photograph included between our crop marks is less than 6 in . and we have ordered a 3-column cut, the engraver will enlarge the victure until it is that width In so doing, be will be obliged to increase the depth proportionately If the editor has not visual ized the resulting depth as well as width, he may find himself with a piece of metal on his hands which will not fit into the space he has reserved for it in the page Likewise, if the picture or the area cropped is wider than the column width stipulated, the engraver will reduce the meture to the required width, with a corresponding reduction in depth Beginners find it hard to visualize quickly the final dimensions of a cut involving reduction or enlargement of the original The reason is that this reduction or enlargement is controlled by square and not linear measure

Practice in scaling pictures will soon accustom the picture editor's eye to the results of enlargement and reduction and help into avoid errors of judgment in ordering halftones. He will soon discover that if he orders a cut twice as wide as his picture it will turn out to be, in total area, not twice but four times as large as the picture he has in hand, or, if he orders a cut half as wide as his picture, the total area will be one fourth the original size

In handling pictures it is customary on newspapers to refer to a "natural 1-column," a natural 2, 3, or 4 column. The fact is that it is impossible to give every newsphoto the precise amount of space in the paper its news value might suggest. The "play" of a picture is at least partly determined by its content. A group shot cannot be squeezed into 1 column nor a single figure stretched across 4 columns. Obvious as this may seem, many beginners forget it.

A full-length figure of a society deb walking may make a splendid 1 column halftone, but in 3 columns the lady might run over the top and hottom edges of the newspaper page A picture

of six debutantes in hathing suits, sitting along the edge of a boat, might look fine in 4 columns or more, but in 1 column, on newsprint, the girls could never be identified A well-known sports editor tells the story of his first experience in ordering a cut for his page He had a panoramic shot of a foothall match which in 6 columns would have made a "splash" on the page But he had dummied in all his stories and the spot he had left for the picture was 2 columns wide, and about 7 in deep. That looked like an important space to him, and so he sent the picture through with orders for a 2-column cut What he had not taken into consideration, of course, was that the depth of the picture would be reduced along with the width Accordingly when he looked for the cut later in the composing room, he was dismayed to discover that his football game had shrunk to the size of a row of postage stamps For his own sake in preparing an accurate dummy, and for the purpose of giving accurate instructions to the engraver. the picture editor learns to scale his pictures

To determine what reduction will do to a picture, draw lightly a diagonal line across the back of the print, from the upper lefthand corner to the lower right Now from the upper left hand corner measure along the top edge the width you intend to have the cut made, and from there drop a straight line down to your diagonal Where it hits the diagonal draw a horizontal him hack to the left-hand side of the picture The ohlong you have produced in the upper left-hand corner is the exact size of the nicture which will appear in the paper

If it turns out to he too small, the experienced editor may look the picture over again and decide that instead, say, of reducing it from its present 4-column width to 2 columns, he would do better, -supposing he can only allow it a 2 column space—to crop it to that width So he picks the middle out of the picture and decides that what is on the sides can be left out. Now he has a 2 column without reduction The people in the picture remain as large as in the original, and the depth remains the same

If the picture is to be enlarged instead of reduced, the ultimate size of the halftone may he ohtained by placing the print face down on a larger sheet of paper, and drawing the diagonal, as described above, from the upper left-hand corner through the lower right, extending it on out over the paper Now lav a ruler along the upper edge of the picture, starting at the upper left-hand corner, and draw the line of the top edge out to the width desired for the cut From this point drop a line to the diagonal and complete the oblong, which will represent the size of the final halftone.

In general newspaper practice at is good advice to crop as much as possible and reduce as little as possible, thereby keeping figures and faces large, even at the sacrifice of background. The coarse newspaper screen will destroy so much detail that faces which are too small are apt to lose their resemblances, and all the drama of facial expression will tend to vanish. Too much reduction may turn a dramatic shot into an uninteresting blotch of ink on the page. But there is a point where cropping is akin to murder. A marvelous action shot must not he cropped so close that the action is destroyed. Caro should always he taken that the cropping does not diminish the picture in any of the three essentials for which it was selected personality, news, and action

Nothing can be accomplished by trying to squeeze the right picture into the wrong space I are already and only a 1-column space is available, either stories must be thrown out to make room for the picture, or the picture must be thrown out to make room for the typo. The city editor may choose to cut and edit a 2 column story to two paragraphs, but the picture editor cannot usually slash his material so drastically Pictures rule the one handling them more often than they consent to he ruled. Try to force them into spots not to their liking and they prove as halky as mules. If they are "uprights" they may not consent to he down and if they are "bonzontal" shots they will not stand up too easily

That is why the wise editor does not make a page layout first and then try to fit in the protures. In the old days when protures were not important, he could determine on a pattern of heads and then fit his stories to it, jumping them or lopping them off if they were not the right size. Pictures make a pattern of their own for the page, which falls into its natural layout around them. They do not work well into preconceived schemes. This does not preclude layout with pictures, as we shall see later. It merely precludes "forcing."

<sup>1</sup> Once the person handling pictures has learned the principles of scaling by practice he may prefer to use a small logarithmic table provided for the purpose, which will give him in an instant the final dimensions of his halftone.

#### RETORCHING TO IMPROVE COPY

Newsphotos, we have seen, should measure up to a two-way standard of perfection. They should tell an important story and they should be good copy for halftone. If they answer the second requirement and not the first, they are useless. A wise picture man is not for a moment tempted by the perfect shot that has no story to tell. But if big news is breaking, or even little news for that matter, and he has only a batch of second-rate shots to get the story over, he uses them. They may be dull or blurry—one or two of them down to the point of being almost undistinguishable—but that does not deter him. In some degree they will serve to carry the facts to the reader's cyc (Fig. 9). Before they reach the engraving plant, much can perhaps be done to them to improve them as halftone copy. This is the job of the newspaper retoucher.

Newspholos are retouched to improve their copy value. This is the most important purpose of retouching. The copy values of the picture, we recall, are clarity of outlines, good detail, and contrast or range of tones from black through grays to white. A print which is satisfactory in these respects can go direct to the engraver.

Retouching is done on the glossy print with water soluble black or white paint or with mixtures of the two to give the various gray shades. The paint is applied with an ordinary camel's hair paintbrush or with an airbrush. The latter is an air operated contrivance which shoots a fine spray of paint onto the picture. Much more delicate and indistinguishable retouching can be accomplished with this spray metbod than with a wash applied by brush.

Since clarity of outline is his first concern, the retoucher examines the print to see if the figures, forms, or faces stand away from the background distinctly. He may sharpen up the outline of a house or a tree, or, in the case of an interior, of a table or desk or chair. He may deepen the profile of a face, which otherwise would fade out in the halftone. There are several ways of sharpening outlines (1) by running a narrow stroke of the brush around them, (2) by toning the whole figure up to a darker shade when the background is light, or to a higher shade when the background is dark, (3) by washing the whole background over

with white or black paint, so that the figures are silhouetted against it, (4) by airbrushing the background just outside the outlines of the figures, so as to create a faint aura of light tone behind them, which shades imperceptibly into the background tint, (5) by faintly airbrushing the whole background with a white spray, so that it is still distinguishable but has been "set hack" as if behind a veil. The first of these methods makes for

Fig. 19 —Retouching accounts for the difference in these two halftones: A. The first was made from the original closely print, which was poor copy: B. The artist then supplied the missing detail and contrast and the second halftone was the result.

fast retouching, but is so crade that it may destroy much of the picture's appeal. A hrush stroke around an outline should not be used unless it can be toned in and sufficiently disguised. When it can be seen it should be rejected by the picture editor. Toning up a figure or face to a lighter or darker tone in order to make it stand out against its background often means practically repainting the whole picture. It should never be done for

outline alone, but only when the detail and contrast are so poor that it needs this amount of work done on it anyhow

Washing over the whole background with white or black paint so as to obliterate it completely is a good plan with some pictures particularly those where the background is unimportant to the story the picture has to tell yet is so full of detail that it distracts the eve from the faces or figures in the foreground Candid-

Fig 19B

camera shots of men in public life are often handled in this way There is, however, a certain harshness to the plain background If too many pictures in the same paper use it, the whole is apt to seem characterless and crude. It is better to reserve the plain wash background for a few shots. Make it white when the foreground figures are dark, and black when they are light. Some times a gray background is preferable, and occasionally the background may be made light on one side, shading to dark on the other, following the original lighting of the photograph. Keep in mind that the purpose of washing out the background is to

obliterate confusing detail furniture and ornaments, foliage on a tree, background figures

Where the background has a bearing on the story the picture reports, it should never be washed out. If its detail is confusing to the foreground figures, either airbrush around the outlines of these to make them stand away, or lightly nirbrush over the whole background, to push it further back. In scenes such as an automobile crash, a fire, a street riot, it would be hetter to airbrush the outlines of important figures, but retain the whole necture intact, hecause every detail of it is a detail of the story itself. In a scene such as a meeting between two great European statesmen, where their mere handshake is history, it might be well to set the hackground back a trifle with airbrushing, in order to dramatize the meeting of the two men. Only good taste can determine which method should be used in a particular case.

Retouching for detail means sometimes painting in essential details, such as eyes and nose and mouth in a face, when these have heen blurred or are indistinct (Fig. 19) More often it means sharpening up the tones in details of the print, so that there will be sufficient gradation for the halftone. As we have already noted, halftone depends upon differences of tons values When the gradation of these is not sharp enough, detail is lost. So the retoucher may make a dark gray black and a light gray almost white, in order to prevent detail from dropping out. A competent retoucher may use a fine hrusb stroke to hring out the pupil of an eye, the pattern of material in a gown, the contours of a mouth, or any other detail which seems significant He may use a touch of white paint to sharpen a high light The purpose of such retouching is to produce not exaggerated effects but natural effects in halftone. The worst that can be said of any retouching is that it shows in the halftone Overdone retouching, like overuse of cosmetics, is vulgar in its effect on the spectator. Only the foolish prefer to paint mechanically perfect cupid's bows on every lady's face and adorn every eye with glittering evelashes Stupid retouching of this sort occasionally brings furious protest from a refined woman reader, who feels—quite rightly—that she has been held up to ridicule Even on movie stars it can become monotonous

Retouching to improve contrast in a print is similar to retouching for detail. It simply means giving the picture a better

gradation of tone, by lightening some tones and deepening others.

The requirements of retouching then, are (1) That it should

are requirements or retouching then, are (1) I not it should hring the imperfect print up to what is needed for good halftone reproduction, and (2) that it should not be distinguishable in the halftone as something painted on or added to the picture

Sometimes very important retouching must be done to bring a picture up to par

The problem then becomes how to disguise the retouching

The better plan is to ask the photographer for an enlarged print of the picture and do the retouching on that (Fig. 20). If the picture came from a service it may be necessary to rephotograph it to obtain an enlargement. If it is a staff photo a new larger print can be made from the original negative. If the retouching is done on the enlargement and this is then reduced in the process of making the cut, the brush strokes and other traces of retouching will usually be found to have disappeared. When there is time and it is thought desirable, a still better result may he obtained by rephotographing the retouched glossy print, retouching this slightly to remove traces of the first retouching job, and then passing it on to the engravers. Such retouching seems laborious and costly, but occasionally it will enable a newspaper to heat its competition by turning a blurred, seemingly unusable shot into a real picture scoop.

Of course the picture editor is mindful of deadlines, and he tries to make a selection of shots which require the minimum of retouching Only for the occasional and important news picture does he ask for retouching which requires a great deal of expert attention. If he dumps a batch of photos requiring retouching into the art department at the deadline, he cannot expect to obtain results.

When the picture editor or any other editor handling pictures on a newspaper does not understand the purpose of retouching, he is apit to demand it where none is needed. If the picture is sharp, detailed, and well contrasted, let it alone. Because of the ignorance of editors, many newspaper retouchers now feel it safer to wash a little paint onto every picture that passes through their hands. When something goes wrong in the engraving or the printing and the picture does not reproduce well in the paper, the editor may seek to blame the trouble on them, if the print was not retouched. So they put on a little paint, just to he able to

E-a 20.4

Fig. 20—The Dionne Quintuplets in their first photograph by William F. Hirst of the Toronto Telegram. Lake most new born habies they were red and so photographed black (A). The Washington Post roade an enlarged print of each so the artist could retouch to lighten dark (ones (B)).

Perkins Wide World Photo)

wash it off while the editor is looking, and thus prove that it is there

The really clever editor tracks down the real causes of had reproduction and does not oblige the retoucher to resort to trickery in self-defense. He knows that the right amount of retouching is what is required to hring the picture up to reproduction standards, whether this means none, or a very slight amount, or so much that it seems like painting a new picture over the old shell.

In a later chapter we shall return to the art department, to see that even perfect picture copy may he enhanced by certain methods which are not, properly speaking, retouching Before we consider these it is hest to learn the rudiments of the engraving process

#### A APPLICATION EXERCISES

- 1 Suppose you have ten pictures and wish to place them, sizes indicated, as follows
- a The Duke and Duchess of Windsor walking down the gangplank upon arrival in America, 3 columns p 1.
- b Gloria Browne, society debutante, I column, society page,
- c Eighty-year-old university building burning on local campus, 4 columns, p 1,
- d Local boy who won tristate golden gloves championship training for his first professional fight,
- e Alyce Lange, who will make her debut tomorrow, I column society page,
- f Residence of fire chief hurning while chief and his men fight university blaze, 3 columns, p 3,
- g The Duke and Duchess of Windsor embarking at Cherbourg for America, 3 columns, p 2,
- h English 'hope' training for title fight with Joe Louis, 3 columns, second sports page.
- Young society girl who will marry the youthful president of her college after graduation, both residents of small college town 200 miles from, and in same state with, paper's place in publication, 2 columns, p. 1, second section, state edition,
  - j Mayor recently elected by strong American Legion vote in small city in other part of state, I column, p 3, first section, state edition
- Indicate by slugs how you would identify these pictures for publication, last two in state edition only, remainder in complete city edition 2. Take recent copy of nearest metropolitan paper. Rule a sheet of
- 8 by II paper as layout schedule sheet Indicate a layout for a front page, using front-page pictures for city edition listed in Exercise 1 Show assumed news atoms for pictures finishing page with news from your selected paper,

dropping out appropriate stories to give room — Change make-up of selected paper entirely, if you wish, but be prepared to justify your make-up

- S Try retouching one print for clearer outline with soluble paint and a camel's hair brush —Be prepared to explain an advantage of this type of retouching and a disadvantage of the stype.
- 9 Take a candid shot of a "news figure" in your community Obliterate the background Explain why you would do this and why many such treatments in a paper would give what bad effect
- 10 Begin searching for pictures in newspapers which have been overretouched. Turn in with next assignment at least two, explaining the defects.

## B CHAPTER ORGANIZING QUESTIONS

- 1 If several pictures of society girls are to be run with announcements of social events, or alone as deb news, what precaution is taken in slugging them for individual use? Why is this advisable?
- 2 Suppose you get a picture showing the political boss of your state shaking hands with the governor after political reconciliation following a sustionally reported fight in which the governor practically broke the back of the machine an 8 by 10 pint of the scene in governor's office including furniture, wall map, pictures, etc. What would you do as picture editor to make this picture as dramate as possible?
- 3 Suppose you have an 8 by 10 print of two gangsters' hodies where they fell in governor's office in gan battle in which state police killed them as they attempted to assassinate the governor, furniture overturned, wall bullet marred. How much of this print would you print?
- 4 Explain two methods for putting crop marks on a print without injury to the print for future use Explain a method for applying crop lines without marking the print at all Explain dangers in marking crop lines How should crop marks be put directly on face of print?
- 5 The advertising department requisitions a 1-column cut of the Unknown Soldier's monument. You have an 8 by 10 print of it showing background objects. Copy for the advertisement is built around the

inscription, which must be legible in reproduction What will you do with the print?

6 Explain what a "mortise" in a cut or layout is. Why is it used? Set forth a concrete situation in which you would crop a picture for a specific layout using a mortise.

7 Discuss "fancy" cropping and ornamenting

8 Suppose the space between crop lines on a print is 4 by 6 in If you order a 36-pice width out, what will be the exact dimensions of the halftone in probes?

9 If you order a cut one-third the width of a 6 hy 8 cropped space, what proportion of the area of the cropped space will the area of the cut he?

10 Suppose you have a picture reporting big news in which the figures are dark against a light background but in which there is danger of the figures in reproduction blurring into the background and in which detail is defective Explain five ways to improve this picture, one or more of which might be used before the engraving is made.

11 If an excellent news shot shows a hillboard which might be construed as free advertising and which otherwise mars the news portrayal, what can be done about it, if the bullboard is so placed as to preclude cropping it out?

12 How may tones be deepened and shadows intensified?

#### CHAPTER X

# PHOTOENGRAVING, PLANOGRAPHY, HALFTONE COLOR WORK

## PREVIEW QUERIES

Why is the metal plate for printing photographs in a newspaper called a halflone, whereas the plate for printing cartoons is called a line cult

How may the halftone and line-cut processes be combined for newspaper layouts, whereas a line cut cannot be used to reproduce a photograph?

How can photographs be transferred to zinc plates in such a way as to "emboss" them so that they will, when inked print like type?

Does any method exist for printing pictures with a metal plate the surface of which is flat?

When you take a picture, it is reversed in the negative printing it on paper hings it right again. If you were to print your negative on metal as you print on paper, your plate picture would be positive again but reversed when printed in the newspaper. What is done to nevent thin?

What is meant by an "80-line screen"? What would happen if a 150-line screen halftone were printed in a newspaper?

Where is the screen placed in rephotographing a picture to make a halitone?

Why do the palest tones in a newspaper reproduction of a photograph, consist of fine black dots whereas the darkest tones consist of fine white dots?

If a halftone engraving is an essentially flat surface composed of tiny dots inked as type is, how can a picture be printed to reproduce several colors?

Why is color printing not apt to be used in the near future for the general run of news pictures?

AMONG the arts, photoengraving is the natural twin of news photography. The news camera brings us a daily pageant of the contemporary world, more fascinating and more accurate than any other record of events. Yet without photoengraving this record would be lost to the reading public, for the simple reason that pictures could not be reproduced with print. The engraving process, itself involving photography, makes possible

the swift reproduction of a million or more copies of a single picture, by translating its tones and outlines into a relief surface which can be used for printing. The newspaper engraving plant may seem bewildering to the editorial man who visits it for the first time. Yet the steps by which any sort of picture—whether photograph or work of a newspaper artist—becomes a metal printing surface are really very simple.

In this chapter we shall consider two fundamental engraving tasks the making of the cuts and the making of halftones Strictly speaking, only the second has to do with the reproduction of photographs — In practice, combinations of the two occur in newspaper layouts

A line cut is a reproduction in metal, for printing purposes, of a drawing consisting of black lines or dots, with no intermediary tones. The newspaper artist usually draws the original for the line cut with black ink on smooth white paper or card. He may vary the appearance of his drawing by filling in parts of it with solid black, with crosshatching, or with simple dots. But he cannot employ wash to imitate the blending of tones found in a photograph.

A halftone is a reproduction in metal, for printing purposes, of a photograph or of any other picture which like a photograph has a continuous ione surface, showing gradations from pale gray to pure black. The original may be a photo, or it may be a charcoal or wash drawing. In any of these the solid or continuous masses must be broken up into small discontinuous masses or dots, after which the procedure parallels that for making a line cut. The breaking up, as we shall see, is accomplished by the action of the halftone screen.

## FIRST PRINCIPLES OF ENGRAVING

In order to understand better what happens in the production of either a line cut or a halitone, imagine for a moment that you have sketched a picture on a sheet of smooth zine with an inky substance which is resistant to and You now dip the metal into an aid bath which eats the surface away, everywhere except where the acid-resistance substance you used for your drawing provides a protective coating. When enough of the metal has been etched away you remove your plate and clean off both the acid and the substance with which the neture was drawn. The

lines of your sketch now stand up above the portion of the metal the acid dissolved If your drawing was in bold, strong lines, they are now there in relief on the metal, with flat upper surface like the surface of the original plate Pass an inked roller over them, and they will print your sketch onto a sheet of paper

If your original sketch had been made on paper instead of on the metal itself, your problem would have been to transfer it to the metal, so that such a process as just described could be carried out. The first steps taken by the engraver, then, when be is lianded a picture to be made into a cut, are for the purpose of getting the picture onto the metal. The simplest way to get it there is by photography

A news cameraman makes a photographic negative and prints it onto a sheet of paper. An engraver makes a negative in his process camera and prints it onto a sheet of polished zinc over which he has previously spread a thin coating of a substance which, when exposed to light, becomes insoluble in the developing both and adheres to the metal. Thus, wherever the light passing through the negative has printed the picture, the coat becomes insoluble, while whatever is not included in this printed picture can be washed away. This leaves the picture in the form of a light and resistant coating on the metal. The engraver gives the liack of the plate a protective coating, usually of asphaltum, and then immerses the plate in the acid bath, to etch away the portions of the plate which remain bare and are therefore subject to the attack of the etching acid.

This description has been simplified in order to make the process intelligible to the beginner. Now let us go back and follow the engraver step by step as he turns out a line cut

## MAKING THE LINE CUT

Here on the table in our engraving plant are a number of cartoons and line drawings scheduled for tomorrow's paper. The artists bave executed them with firm black line on smooth white card. Outlines are strong and definite, since these are the sort that will reproduce best.

The engraver prepares to photograph the first of these in bis process camera. This is a large camera of permanent construction, on a track, with a fixed frame to bold the picture copy. The whole apparatus is mechanical, even to the focusing, which is

figured by means of a rato table After he has fixed the copy in the frame, the engraver sets the camera on the numbers previously determined by the ratio table in order to secure a negative of the desired size for making the cut. Since contact printing will be used to transfer the picture from the negative to the zince plate, enlarging or reduction must be accomplished at this point.

For negative, the engraver uses a roll of film known as a strip film. It consists of a photographic emulsion on a paper or cellulose base. The strip film comes in widths of 6, 9, 12, or 19 in and is 150 ft long so that many pictures may be copied before a new roll need be placed in the camera. The emulsion or film is of a consistency which is strong enough to permit it to be handled alone, when the paper backing has been removed.

The picture in the copy frame is illuminated with mercury tube or are lights and the exposure made. The camera lens is a fully corrected optical instrument with a diaphragm which the operator opens or closes as required to obtain the correct exposure. After exposure the film is placed in developer and then in hypo or fixer. In the fruin bath it secarates from the paper.

The engraver can now strip the film or parts of it onto a large plate glass, grouping and combining negatives as he desires, preparatory to printing them on a large sheet of zinc Copies of many pictures are thus grouped and printed, as the large sheet of metal is more convenient to handle in etching. When etching has been completed the various cuts can be separated with a saw As he puts the negatives down on the plate glass he reverses each A moment's reflection will show the reason for this take a picture it is reversed in the negative but comes right when you print the negative onto paper But when you are printing from a metal cut there is one more step added, thus (1) The original picture is (2) reversed in the negative, (3) printing on metal would bring it right again, but (4) printing the metal cut onto paper would reverse it This final result would be wrong and it is corrected by reversing the film when stripping it onto the glass

We shall see that the engraver, in grouping the stripped films to form a large negative for printing on metal, may work out many special combinations. For instance, he may surround a halftone negative, made from a photograph, with a horder of line negative made from a drawing The resulting cut would be known as "combination line and halftone" Many interesting effects are produced in this way

When the large composite negative is completed and dried, it is ready to be transferred to the metal. This may be zinc or copper, 16-gauge and highly pobshed. Zinc is generally used for line work and for hoth line and halftone in newspaper work. Copper is hetter for fine halftones, but few newspaper engraving plants now use it hecause of expense.

Preparing the Metal The metal plate requires special preparation to receive the photographic image in with pumice powder to remove all signs of impurities or grease. This gives it a surface to which the sensitizer he is about to apply will adhere. Now he gives it the sensitizing cont of shellac reduced with ammonia and water and sensitized with ammonium hichromate. The coating is flowed over the plate, which is inverted and whirled over heat until dry. The inverted whirling gives even distribution of the solution over the entire plate.

Printing on the Metal The sensitized metal plate and the negative side of the plate glass are brought together and locked up in a printing frame in which a vacuum is created to produce perfect contact. Then powerful are lights are turned on the glass, so that the negative is printed on the zino. Wherever the light, passing through the negative, registers the picture on the coating, it hecomes insoluble indeveloper. Wherever the light has not penetrated, because it was stopped by the opaque parts of the negative, the coat remains soluble and washes away during the next step, that of developing the picture on the metal

Developing the Picture Image on the Metal The plate is now developed and the soluble portions of the coating are carried away. The insoluble portions of the coating remain on the sine plate in the form of a printed picture, and the coating which adheres to the metal will protect the zinc heneath from erosion in the acid bath.

Etching Begins Now the engraver gives the plate its first "htte" in a weak solution of intric acid, which attacks the unprotected portions of the surface and hegins eating them away However, he proceeds with the etching cautiously The lines of the image are well protected on the surface of the metal, it is

true, but the acid may strike down underneath this surface coating, just as soon as the depth of the "hite" permits it to do so, and thus the image may be destroyed by undercutting

While danger of undercutting is helieved to he not so great as was once supposed, the engraver does all he can to avoid it. He gives the plate only a slight first etching. Then he removes it from the acid hath and carefully dusts the sides of the lines, which are now in elight relief, with a resinous powder, melting it on to give protection from the acid where it touches the sides of the lines. He then remmerses the plate in the acid hath, etching away the unprotected portions of the metal to a greater denth and obtaining more relief for the lines of the mage

As soon as the depth of the etching again creates the danger of undercutting the lines, he must remove the plate and repeat the process of coating the sides of the lines with resmous powder

Each lite or immersion of the plate in acid hrings the lines of the picture image into greater relief, while the care exercised in protecting these lines insures that they shall he firm and strong, with good supporting base. When the engraver judges that sufficient depth has been obtained for the otching—usually after four or five lites—he removes the plate from the acid hath scrubs it thoroughly with lye, and polishes the top surfaces of the lines, which now stand up in hold relief

Routing Out Etched Portions The etched parts of the line cut are still further deepened or removed entirely with a high-speed, vertically revolving cutting tool known as a routing machine, which leaves holes in the plate where the excess metal has been eliminated The plate, we recall, is a large sheet of zinc on which not one but several pictures have been reproduced. The individual cuts are now separated with the routing machine or with a saw.

Making the Cut Type-high The cuts have a relief printing surface, but they must be made the same height as the type with which they will he locked in the newspaper-page form, when the printer makes them up into pages along with the slugs from the linotype machines. Sometimes this is accomplished by mounting the cuts in the engraving plant. Their edges may he heveled to give a nailing surface, after which they are nailed to a wooden block the exact size of each cut, or the cut may he soldered to a metal base to make it type-high.

Most oewspapers are ahandoning the wooden hase today, hecause unless it is special laminated wood it will not stand up under the pressure to which it is subjected in the new model dry mat stereotyping machine. Many no looger mount their cuts at all, but simply lay them on standard-unit steel hase in the page form. Any number of these units may be combined to form the mounting for a cut or a layout. This method has the added advantage that, with the dimensions of the layout furnished him, the printer can huild the hase into the page without waiting for the cuts to arrive, and merely lay these in position at the last moment.

## MAKING THE HALFTONE CUT

So far we have watched the cograving process only in the reproduction of a line drawing. We saw the engraver photograph the drawing to obtain a negative, from which he pinited the picture onto a sheet of polished zoo, then etched away the parts of the metal not contained in the image, so that the lines of the picture hecame relief priotiog surfaces on the metal. This seems relatively simple. But if the picture had heen a photograph, with continuous tones instead of lines and white spaces, there would have heen onthing to etch away. How then, one might ask, could relief surfaces have heen obtained?

Photoengraving overcomes this difficulty by breaking up the continuous or blending tones noto minute printing surfaces or dots and minute areas that can be etched away. The dot formation of the halftone carries the tone values of the picture to the printed page in discontinuous form. If the halftone dots are small enough and frequent enough to escape attention, and if they are in varying sizes and pattern, so that they carry less ink to the page for the lighter tones and more for the darker tones, they will succeed in simulating for the eye the whole tonal range of the original photo

The medium which accomplishes this breaking up of the continuous tones of the photograph is the halftone screen, which, simple as it is, is one of the most remarkable achievements in the listory of etching

What the Halftone Screen Is, How It Is Made Rephotographing an ordinary photograph through a halftone screen is like viewing it through a curtain composed of minute holes which let

through only tiny patches of the picture. The screen is a double thickness of glass, with ruled lines intersecting each other to create the infinitely small apertures through which the light is reflected from the original picture. Examine any printed picture in your newspaper and try to visualize the fineness and closeness of the lines which could result in dots so small and so close together. Yet the screen used for these newspaper cuts is coarse compared with those that are used for the best halftone work.

Alongside the task of accurately ruling a piece of glass with 150, or even with 80 or 60 lines to an inch, the manufacture of fine watch movements seems fairly simple Actually only a few firms in the world do the 10b well enough for commercial purposes They do not attempt to put rulings in two directions on the same piece of glass Rather, they rule two pieces and then cement them together so that the lines on one intersect the lines on the other To rule a piece of glass it is first covered with wax and then the wax coating is ruled with delicate incisions. Into these acid is poured, which etches faint lines on the smooth glass surface The way is then removed and the etched lines are filled with black ink. The lines are placed on two pieces of glass diagonally, in such fashion that when one is cemented to the other the lines will cross each other at right angles This makes for a better dot formation than if the rulings were on the strught perpendicular, for this would result in a pattern more noticeable to the eve

Position of the Screen It might seem natural to expect this screen to be placed between the picture to be rephotographed and the engraver's camera. But that is not the case I the screen is in the camera, back of the lens and immediately in front of the halftone negative or strip film. The light reflected by the varying tones of the picture are projected by the lens through the screen onto the negative, where they result in dots of various sizes and shapes

Theory of Dat Structure Technicians have done much research on the nature of the dot structure produced by the halftone screen It is the result of a combination of factors, among the most important of which are (1) the quantity of light reflected through the lens from the dark and light tones of the original picture, (2) the aperture of the lens, (3) the proximity of the screen to the sensitive plate

Examine any printed halftone in book or magazine or news paper which has a screen coarse enough to reveal its pattern, and observe that the palest tones of the picture are very fine black dots, while the darkest tones are fine white dots on a black hackground. In other words, in the light portions the dots are the metal printing surface, while in the dark parts the hackground is the metal printing surface and the dots are etched out of this

To understand this, let us see what happened when the original photograph or glossy print was comed by the engraver in his process camera The palest tones in this glossy reflected a large amount of light through the camera lens and screen, producing a black surface with white dots on the negative The intermediary tones of the glossy produced a checkerhoard of almost equal black and white squares The more light was reflected through the lens the larger the black squares became, until the high lights were almost solid blacks with white pinpoints. The darkest tones of the glossy reflected so little light through the lens and screen that the negative remained almost clear, with only tiny black dots where a little light was reflected to the negative through the screen's openings In the subsequent printing of this halftone negative on metal, the pattern is reversed-so that the originally lighter tones produce black dots on an unexposed hackground, the darker tones a black background with unexposed dots

As the unexposed parts of the metal surface will he attacked by the acid, it follows that the hackground of the light tones will be etched away, leaving dots that stand up to the printing surface. In the case of the dark tones the acid will attack only the dots, thus etching out holes in the otherwise protected flat metal printing surface.

In ordinary halftones it is evident that even the high lights will have a faint, dat pattern. This detrects concentration to the effectiveness of the printed picture. In engraving practice there are several methods of restoring the high lights to the pure white they were in the original photograph. Sometimes they are restored, but often they are not, hecause to do so adds to engraving costs.

The halftone negative is usually stripped onto a large plate glass, as described in the case of the line cut, and printed in a contact frame onto sheet zinc or copper Copper is used for fine

halftone work, but zine is more often employed by newspapers Preparation of the zine plate for printing has been described. The printing is carried out in a contact frame as it was for the line cut. The only difference is that instead of having an image in line transferred to the metal, we now have an image on the metal in dot nattern.

In etching the line cut, the engraver was very careful to prevent the and from undercuting the lines of the image — In etching the halftone, he permits the and to eat away the metal of the highlight dots until these dots are very small — At the same time the and is of course deepening the dots or boles in the dark tones of the neture

Fine-screen Cuts on Copper Fine screen cuts on copper will not be used for newspaper purposes, but for commercial work and illustration. The method just described is somewhat modified when copper is used instead of zinc. The metal is given a sensitizing coating of ammonium bichromate solution, with fish glue. When dry this forms a hard yellowish top on the metal which is both light sensitive and acid resistant. It is soluble in water except where it has been exposed to the action of light, and there it hecomes insoluble.

The halftone negative is contact-printed onto this sensitized metal, which is then developed in water. The unexposed fish glue washes away. There remains after development a faint dotted pattern of fish glue which is a reproduction of the picture image. The engraver may use a dye on this to bring it out sharply so be can examine it. Then be bakes the top onto the plate by applying heat and proceeds with the etching. The fish glue forms a protective covering for the metal, which everywhere else is sattacked by the acid.

A first "bite" is given the metal in a bath of iron perchloride, which should etch it away to a good printing depth. The plate is then removed and its surface is filled in with white powder, so that the engraver may compare it with the copy. Any tones which he thinks should be protected against further etching he coats with an acid resistant, before giving the metal its next bite. As the final stage the engraver may apply the etching acid to small areas with a brush

The newspaper halftone on zinc receives no such careful treatment. We have briefly described fine-ecreen work on copper

because the picture editor will wish to understand it, if only as a comparison with the coarse-screen engraving he is using

#### PROVING THE HALFTONE AND LINE CHTS

All cuts, whether halftone or line, are proved on n hand press in the engraving plant before they are delivered. The proofs are examined by the engraver to make sure that his work has been properly carried out. Then cuts, proofs, and original photographic copy are delivered to the cut bank in the composing room of the newspaper. It is the duty of the man on the cut bank to assemble layouts, when these are made up of separate cuts, to base them up if metal base is used, and to put cutlines which have been set with each cut, before delivering it to the man who is making up the page.

#### HALPTONE COLOR PROCESS

Before leaving the subject of halftone engraving the student will want to know something of the manner in which halftone is used to reproduce a photograph or painting in full color. As a matter of fact, most of the full color printing appearing in newspapers today is in the rotograving section and is not the result of halftone engraving. Rotogravine methods will be described in a later chapter, but they will be better understood if the balltone color process is analyzed here.

Color photography mny have recorded a score of softly blended hues, or the painter may have used in wide range of pigments in transferring his subject to canvas. Halftone can sort out these mingled vinhes reduce them to the three primary colors translate each of these into a halftone printing surface just as it did a black and white photograph and then, by successive printing of the plates with yellow, red, and blue ink, can obtain a picture closely resembling the original. In actual practice a fourth, or black, halftone plate is also used for the black printing gives strength and detail and brings out the neutral tones of the original.

Making Halftone Negatives for Color Work. The halftone negatives made for color engraving are called "separation negatives" since they separate the colors found in the original, recording them on separate films. The separation is accomplished by means of color filters placed just behind the lens of the engraver's

camera, through which the light reflected by the original passes hefore it strikes the negative. These filters are gelatin films dyed with aniline to colors which are complementary to the primary colors of light. By means of the red filter a halftone negative is made of all the hlue in the picture, with a green filter all the red is photographed, and with a hlue filter all the yellow. Even when colors are in combination, they will be filtered out—the red out of the purple in the original picture, the yellow out of the green, etc—so that the resulting negative of each color carries in halftone dot structure a graduated black-and-white record of all the varying amounts of that particular primary color present.

The negative for the hlack plate depends upon the discretion of the engraver, who must decide according to the tones of the original what color filter to use, to get a hlack printing which will add strength to outlines and details and back in tones where depth and shadow are required but which will not print over and muddy the clear pale tones of the picture. In practice the negative for this black plate is often made with a yellow filter

If different color filters were used, but the halftone screen remained in the same position for all four evposities, the resulting four color plates would all show an identical dot pattern, and in printing the dots of one color would tend to fall upon the dots of another. At first that was the way it was done, but it was found by experience that the coincidence of dots did not give satisfactory color gradation in the printed picture and did produce conspicuous and annoying pattern, or morre effects. Today the engraver's camera used for color work has a circular halftone screen which turns in a frame on which the 360 deg of the circumference are indicated. By turning it, the operator can vary the position or angle of the screen for each exposure, thus obtaining a different position of the dots in each halftone color plate.

It will be recalled that the lines of the screen intersect each other at right angles, so that each pair of intersecting lines has four terminal points in the circumference. Accordingly the total variation in screen positions for the four exposures would have to he less than 90 deg. It was found by experiment that altering the screen angle 30 deg for each color gave a satisfactory dot pattern in the color printing. But this allowed only for three, instead of four, exposures. Further study showed that the yellow

produced little pattern in printing and could therefore he close to the other colors. The usual procedure is therefore to make the exposure for the black plate with the screen angle at 45 deg, for the yellow plate at 60 deg, for the red at 75 deg, and for the blue at 105 deg. This gives 30 deg variance between hlack and red and between red and hlue, while yellow is separated from the hlack and from the red by 15 deg.

Each of the halftone color negatives is printed on metal and etched exactly as described for ordinary halftone. In printing, the yellow plate carnes yellow ink, the red carnes red ink, etc., and as each plate represents the gradations of that particular color which were present in the original picture, the four succesive printings result in a reproduction of the tints of the original At least, theoretically they do, as a matter of fact, halftone color nork is hy no means so accurate and precise in duplicating tones as this description might imply A near perfect result depends upon the skill one might call it the "sixth sense," of the engraver, who supplies in the etching process much of what the regatives failed to record He must be able to judge how strong a printing impression will be required of each color plate and etch it accordingly Several times during the etching process the plates may he proved and the printed picture compared with the original for discrepancies in tone values Then, by further etching etreneth will be supplied where it is lacking

Whatever the difficulties, it seems likely that newspapers are going to go in for full-color halftone in the future. However, it seems probable that for some time to come color will be used only for features and for advertising. We may expect to see the news of the world covered as we are seeing it today, in black-and white halftone. Nor need we feel too hadly about this, it has decided advantages

#### PLANOGRAPHY

The photoengraving processes described above are employed by almost all newspapers today in reproducing newsphotos and other art work appearing in their pages but in many allied fields of publishing another method is rapidly gaining favor. It is photolithography, combined with offset printing, and is currently referred to as planography.

Planography represents a method of printing from the flat surface of a metal plate, thereby eliminating much of the expense involved in photoengraving. Growing popularity of the planograph process can be attributed heth to the reduction of costs as compared with those for making ctched plates of copper or zinc and to the fact that offset printing yields highly attractive results.

Often the advertising and circulation departments of the newspaper may order booklets and other printed matter from an outside planograph firm. It is therefore important for the newspaper worker to know something of what this process involves

History of Planography In order to understand photolithography, we must go hack to the more or less accidental invention of hithography by Aloys Senefelder in 1796 Senefelder, a musician of Munich, Germany, had become impatient with the casygoing methods of the printers of his day and with the long periods of waiting for them to turn out copies of his manuscripts. He hegan looking around for a way by which he could reproduce his sheets of music at home

For a long time he searched vaguely His attempts to etch copper plates and print from them were unsatisfactory Meanwhile, from a neighboring quarry he had bought some Kelheim stone for use in mixing his inks. The stone attracted his attention as a possible substitute for copper, since its surface could be

hrought to a high polish not unlike the polished surface of the metal. Senefelder hegan etching on the stone, but later he simplified the whole process by drawing the notes of his music hackward on the surface of the stone with a greasy ink of his own invention and printing therefrom. At the time he had no thought of the possible artistic applications of his method, heing uniquely interested in the fact that the Kelhem stone was cheaper than copper. When later he demonstrated his process in Great Britain it was halled by many artists, who used it to produce the heautiful lithographs which have come down to us from the mineteenth century.

Printing from a Flat Surface The importance of Senefelder's idea was that it provided a method of printing from a flat surface. The gray of buff-colored limestone he used was peculiarly suited to lithography hecause of its homogeneous structure, its ability to take a polish, and other characteristics. That this stone occurred in the region where Senefelder lived was a fortuitous circumstance to which we doubtless owe the invention of lithography. Senefelder did not confine himself to the stone plates, once he had evolved his method. There is evidence that as early as 1818 he was experimenting with zinc plates. In the early days of lithography hoth zinc and aluminum were employed for flat-surface printing. By 1870 aluminum had gained wide acceptance as a substitute for Kelheim stone.

The development of photography was almost simultaneous with that of lithography, and its appearance promptly suggested to many minds the possibility of substituting a photographic image for the work of an artist on the lithographic stone or metal plate. The first photolithograph was made in 1852 in Priis, by a lithographer named Lemercier, aided by an optician and two chemists who were also amateur photographers. These four Frenchmen covered a lithographic stone with asphalt or bittimen, exposed it under a paper negative, and then developed it in turpentine.

In 1859, John W Oshorne of Melhourne, Australia, coated fine linen paper with gelatin and albumen and on it made a lithographic transfer by photography On March 4, 1873, the New York Daily Graphic, a daily illustrated newspaper produced by lithography, created a sensation when it appeared on the newsstands I twas printed by means of photo transfers on stone Offset Printing A better method of printing, however, was required before photolithography could come into its own Tbis development did not occur until recent times When Ira W Rubel, a New Jersey printer, discovered he could print onto a rubber blanket and then offset the impression on almost any kind of paper, be gave surface printing the tool which was to change the older forms of photolithography into the modern rapid planograph process

Rubel's invention, like that of Senefelder, was largely the result of chance Tin-plate decorators had for years been employing a method of printing by offsetting a design from a tin plate to a rubber blanket and then to the surface to be decorated It is unlikely that Rubel was familiar with that fact The offset printing idea occurred to him while he was running off a job on his presses The impression cylinder had skipped an impression, thereby transferring the image to the rubber. With the next impression it was printed on both front and back of the paper The impression on the top of the sheet was made by the metal. that on the back from the rubber blanket On comparison Rubel found the printing from the blanket as clear and in some respects more attractive, because it had greater delicacy. After expenment, he succeeded in constructing a press in which the impression was regularly transferred from a metal cylinder to a rubber blanket and thence to paper The Rubel Offset Press, the first of its kind, was followed by many others

At first, offset printing while fairly successful for reproduction of art subjects, was regarded as giving poor results when the copy involved type matter. Also, photographic reproductions made by planography were less sharp and brilliant in effect than those produced by photoengraving. Many of the early objections have now been eliminated by better offset presses, by more expert preparation of the photohithographic plates, and by manufacture of papers specially adapted to this type of printing Today, high-speed offset printing offers a method of reproduction which represents a great saving of costs on many kinds of work.

In applying photolithography to printing it becomes necessary to transfer the photographic print directly to a metal sheet which can be bent and attached to the roller in the offset press, since the intervening steps of stereotyping and easting a special plate to fit the rotary press cylinder have been entirely climinated

Steps in Planography Let us imagine ourselves in a modern planograph plant and follow the procedure by which copy is reproduced

The first step parallels the work of the photoengraver Here is the same large stationary camera, through which all copy must be rephotographed, with or without the halftone screen, depending on whether the tones to be reproduced are continuous or discontinuous. The original copy—photograph, drawing, typewritten sheet, printed sheet, or any combination of type and pictures—is attached to the large copy board of the e-mera. In rephotographing it will be possible to obtain an enlargement or reduction, as in photoengraving. There is one difference at this point the planograph operator uses a heavy hase film for hest results in halftone reproduction and a tough paper film called litholoid for line work. Unlike the photoengraver he rarely needs to strip the film from its hase, although occasionally he may resort to this procedure, in which event he employs a thin hase film

The next step is the regular development of the film Retouch-

ing on the film may he done when necessary

The developed films are now pasted down on yellow opaque paper in a large layout the same size as the zinc plate to which they will be transferred. This layout may represent not one hut several different printing jobs, or different pages or parts of the same job, which will be cut apart after printing on paper is completed. For the time being, the purpose of the layout is to utilize completely the metal sheet. In preparing the layout the yellow paper is cut away helinid all hut the edges of the films, which have been turned over or "reversed," as explained in photoengraving, to avoid the picture being reversed in the final print.

The metal plate used in planography is usually of zine, though sometimes of aluminum. Unlike the plate used in photoengraying, its surface is not highly polished but has been specially grained so that it will retain mosture. We shall see later what the purpose of this is. The preparation of this grained surface on the zine is accomplished by the action of abrasives. The sheet of zine is fastened to the bottom of a trough and covered with a thin layer of powdered abrasive substance and a layer of glass or steel mathles. The trough is then mechanically rocked, so that the mathles roll hack and forth over the surface of the metal,

pressing the abrasive into it and creating tiny indentations or scratches. The graining of the litho plate varies according to the inhrasives used and the weight and size of the marbles. Its purpose is to create a surface covered uniformly with little wells or indentations for water retention. In addition to graining, the plate is treated to a coat of sensitizer or light-sensitive substance, as in photoengraving.

This grained and sensitized plate and the large layout of films are now brought together in a contact vacuum printing frame, and arc lights are turned on, in order to print the negatives onto the zinc. Where the light, passing through the negative, registers the image on the sensitized coating this coating becomes insoluble in water. Wherever it has not been exposed, because it was masked from the light by the opaque portions of the negative, the coating remains soluble.

Immediately after printing has been completed, the zinc plate is covered with a special developing ink, which adheres to the coating of sensitizer. It is allowed to dry for a couple of minutes, then the whole plate is washed off thoroughly with cold water. The water carnes away the soluble portions of the sensitizer. The water to these parts. There remains on the plate a reproduction of the image, in ink adhering to the insoluble sensitizer. This ink and sensitizer become a printing surface. The plate can now be clamped onto a cylinder of the offset press. With each turn of the cylinder the plate comes in contact with ink rollers which distribute ink lightly on the image, which then contacts the rubber blanket (or rubber covered cylinder). This in turn prints the image upon paper.

Theory of Surface Printing One question immediately arises in connection with planography How does it happen that the ink rollers deposit ink only on the image, and not on the clear surfaces of the plate, for the zinc plate which hears the image is flat. The image to be transferred to paper is neither a relief printing surface, nor is it cut down into the plate. The thickness of the image produced by the sensitizer and the developing in was so slight as to be indistinguishable. The answer to the question can be found in the grained surface of the plate. It is recalled that the metal was grained to hold moisture. Grease and water do not mix, they are, in fact, mutually repellent. Now the clear spaces of the zinc sheet, unprotected by the image, are

really masses of tiny reservoirs, which retain water by capillary action, and therefore render it impossible for ink to be deposited. Nor can the water be forced out of these tiny wells, which hold it firmly below the surface of the plate. On the other hand, the greasy ink image furnishes a surface to which ink from the rollers readily adheres.

Planography therefore represents a method of printing, on an offset press, from the surface of a metal plate which holds greasy ink in the printing areas and at the same time water in the non-printing areas

#### A APPLICATION EXERCISES

- 1 Select two halftone reproductions and two line-cut reproductions from a current newspaper Mount them on copy paper and indicate briefly on the margin what details lead you to conclude that each is a halftone or a line cut.
- 2 In the halftones chosen for Exercise 1, indicate whether white or black dots form the palest and the darkest shades
- 3 Approximately what line screen would you estimate to have been used for each halftone selected?
- 4 In each line cut, circle areas which seem to have been "routed" as well as etched
- 5 For each picture selected above be prepared to discuss in class any defects of the printed appearance. Point out whether these defects probably resulted from imperfections in the photograph as copy, from the engraving or both. Point out at least two good points about the reproduction.
- 6 Select from a current newspaper a halltone reproduction of a news pietre which would lend itself to appropriate hine-drawing additions for a feature page layout consisting of both halftone and line etching. Use more than one halftone if you wish. Indicate on attached copy paper what line-etching accompaniument might be prepared for this proposed layout.
- 7 Select from a current magazine a halftone color picture (not roto-gravure) and point out how many different plates were used for printing this picture.
- 8 Find in a circular, booklet, or magazine a photograph reproduced by offset printing or planography Compare the result with that obtained by halfone

#### B CHAPTER ORGANIZING QUESTIONS

- 1 What is there about a photograph or painting that makes it impossible to reproduce it for printing by rephotographing it directly and etching the resultant zinc plate, as is done with a line drawing?
- 2 Can a halftone be made of a line drawing? Explain why you think a halftone would be more or less effective for printing cartoons in the newspaper

- 3 Years ago many newspapers, the Kansas City Siar, for instance, preferred to have artists make line drawings of photographs to print with line cuts instead of halitones What reason do you suppose they had?
- 4 Explain how an engraver makes a halftone specifically larger or smaller than the original photograph
  - 5 What is used to sensitize the metal for printing a picture upon it?
- 6 Why does not the reflected light in the rephotographing process affect the negative equally all over?
  - 7 What is meant by giving a plate a "hite"?
- 8 Why is a plate not left in etching acid long enough to complete the etching the first time? What is done when the plate is removed after a hite?
- 9 What prevents the etching acid from eating the back of the plate away?
- 10 Visualize a sensitized plate in a vacuum printing frame with the negative through which light is allowed to pass. What action does the light have upon the chemical coating of the metal?
  - 11 Explain how a halftone ecreen is made. Why are the lines etched on the glass diagonally?
  - the guass diagonally?

    12 Where is the screen placed with respect to the picture to be rephotographed the lens of the engraver's camera, and the strip film?
- graphed the lens of the engraver's camera, and the strip mm;

  13 Why is not copper used as extensively for newspaper halftones as it is
  for commercial work?
- 14 In making a halftone of another halftone, when the original photo graph is not available, why is the screen placed at an angle to the screen in the printed patient?
- 15 What is meant by making an engraving "type-high"? How is this usually done in newspaper forms? Why need it be type-high?
- 10 Explain how the different colors in making color halitones are sorted out in making the negatives Why is a black halitone plate also used in color halitone printing?
  - 17 Why is the screen angle altered in making color halftones?
- 18 Suggestion to instructor It might he highly illuminating to select a typical local news peture published in a near hy paper which has its own photographers and engraving plant, and ask the hussness imanger to compute the following comparative costs cost of taking the picture and making the halitone, cost of sending a reporter out to get the facts for it and then to write a sufficiently long story to present a reasonably similar word picture of the news the picture reports, plus the cost of putting it into type and getting it on to the make-up atone beside the cut with its overline and underlines. The managing editor of a metropolitan paper, in an address at the University of Missouri School of Journalism, said the paper would use more pictures "when times get hetter" Comment on this statement in the light of your findings
- 10 What two inventions made possible the modern planograph process? Explain the principles underlying "flat surface" printing Why is it not generally used by newspapers? Do they ever use it?

#### CHAPTER XI

# MAKING THE HALFTONE EFFECTIVE, DROPOUTS AND SPECIAL SCREENS

#### PREVIEW QUERIES

Does the limited dot translation of a living scene into halitone reproduction distortingly restrict news photography as a reportonal art, or does its selectivity contribute to art?

Have published newspaper pictures become more simplified in final effect, or more "dressed up"?

What basic effect upon the reader do engravers and retouchers seek in working with high lights and background of news pictures?

What is meant by "dropping out the whites"? Why is the method used in modern newspaper engraving?

What results in the published picture does the engraver seek when he opaques the dot formation in high lights so that they become pure black before the engraver's negative is printed on metal?

What is a cellophane mask for dropouts, and what two advantages does it possess over older methods?

What never method may replace the cellophane mask?

How may a balftone for real estate or society sections he made so it will print with the effect of a charcoal drawing or a soft pencil sketch? How may texture or shading be added in the engraver's laboratory

to a line cut which in the original drawing had no shading?

ANYONE who follows a news event from the moment of its enactment through its camera coverage and final delivery to the general public as a halftone may feel that to come extent he has witnessed a losing fight. The full color range of the original scene was lost in the restricted gray-to-black tones of the photograph and these probably suffered a new diministion in their translation into the dot pattern of the halftone, so that what finally makes its way onto newsprint seems but a shadowy and vague representation of the original scene.

Yet pessimism ahout the effectiveness of news photography and hlack and white halftone are only partially justified. All art implies interpretation through selection and limitation, pictorial journalism no less than any other. A sonnet may express profound human emotion, but it must do so mexactly fourteen lines.

A news photograph may earry across to millions of readers the tense drama of the prize ring the grief of a mother unable to rescue her children from a burning building, the deheate splendor of a garden in spring. The fact that it employs so little means with which to convey so much meaning really contributes to the result. It is for this reason that many bear rightly felt that the black and white photograph is a true form of art.

The earliest of those dealing with newspaper pictures seemed unable to convince themselves that the emotional message contained in the picture was enough. They thought they could make the picture more acceptable to the public by "dressing it up in one way or another. So the farther back you look in messpaper and in magnaine files the more you will see of fanctully scalloped halftones intricate hand drawn borders and ornaments halftones in oads and circles or with backgrounds pared away and heads silhouetted against white. The self-consciousness of all this old newspaper art was what made it so bad. Today we save money and get better results. We discard fususness and sech for effectiveness.

# DROPPING OUT THE WHITES

We still work hard at the job of enhancing our hilltone pictures but we do not try to pretty them up. The things we do to them are done to increase their emotionol pull. Some of the methods we employ are carried out in the art department, others in the engraving plant, still others in the composing room or press room but they are all for the purpose of strengthening the message the picture conveys.

A picture loses some of its emotional force when its pure white high lights are converted into pule grays by the halftone screen Even the high lights of the ordinary halftone have a dot formation is we have seen in the chapter on engraving and these dots which give a grayish appearance to the purest whites of the original glossy print detract from the sharpness of the printed picture. To overcome this handleap and obtain pure white high lights is known as dropping out the whites (Fig. 21).

Several methods are in use for dropping out the whites, choice depending on engraving plant and art-department facilities. In making a choice of methods, economy must be considered as well as the nature of the result desired. The oldest, and also the most

Fig. 21—Pure white highlights are effective but cannot be obtained in ordinary halftone engraving. Many methods are used for dropping the halltone dots out of the highlights and these are becoming increasingly economical.

expensive, procedures for dropping out whites are those which are carried out in the engraving plant, and their cost, which may double or even triple the price of a halftone cut, may make them probibitive for regular newspaper work. There are ways to reduce this expense for dropped-out whites, and the picture editor will study them over carefully. Even if he never orders dropouts on straight news cuts, he will certainly want them on many feature pictures. If the newspaper has its cuts made by an outside engraving plant but maintains an art department of its own, it will probably be economical to have a staff artist do the work required for the dropouts.

The various procedures for dropping the whites out of a halitone are as follows

1 In the Engraving Plant When the halftone negative has been stripped onto the plate glass, the engraver opaques the portions that are to be dropped out, by painting over them. In other words, he covers over the dot formation in the high light portions of the picture, so that these portions hecome pure black. When this negative is printed onto the metal plate, the black parts of the negative allow no light to strike the metal, which remains clear. We recall from the last chapter that the image on the metal, in dot formation, is what protects it from the attack of the etching acid. The clear parts, heing unprotected, are therefore etched away to a depth below the printing surface.

Another possible method of dropping out whites in the engraving plant is to etch the plate in the regular way, then give the tone
portions of the picture a protective coating on the plate and
proceed with a further etching until the dot formation in the high
lights is destroyed and these portions have sufficient depth. Few
dropouts are done in this manner today, both because of the
etching skill required and because of the expense.

Even the opaquing of the halftone negative is a job that requires much labor by a bigb salaried artisan. The engraving plants themselves are resorting to cheaper procedures, with equally good results on most jobs. For some years a method known as the Bassau process was in favor, by means of which the halftone screen was so mampulated during the exposure that the high-light portions of the negative were blurred or opaqued, instead of showing a dot formation. This screen manipulation, while it opaqued the high lights, also destroyed some of the

tone values of the image and the resulting halftone cut lacked quality

This hrings us to the dropout procedure most widely employed in engraving plants today

2 The Cellophane Mask for Dropouts A sheet of heavy cellophane is laid over the photograph, and an artist then paints on this cellophane with black paint, completely covering all portions of the photograph where there is tone, but avoiding the high lights. The result on the cellophane is a solid black silhouette of the tone portions of the picture. The high light portions of the picture remain clear on the cellophane.

Until recently it was necessary for the engraver to make two negatives in his process camera a halfone negative of the original glossy and a line negative of the cellophane mask. In this line negative what was black in the mask became clear, while the clear parts of the mask hecame black. The line negative was then stripped on top of the balftone negative, so that the clear portions of the line film were directly over the tone portions of the halftone negative, while the black portions of the line film covered the high light regions of the halftone. This double film was printed on the metal. As the black parts prevented the light from striking the metal, only the tone portions of the picture were transferred to the plate. In the subsequent etching the high lights were attacked by the acid and etched to a depth below the printing surface.

To comprehend this procedure the beginner should keep in mind that the high lights are left clear on the cellophane mask, hecome black on the line negative hecause the cellophane allowed the light to pass through and strike the film, but hecome clear again on the metal hecause the black parts of the negative stopped the light from touching the plate

The cellophane mask may be used to drop out a large number of small highlights in a photograph or in an artist's charcoal or pencil sketch. It is also useful as a quick method of sithouetling figures against a white hackground. Here the artist paints over the figure in black but leaves the whole hackground clear on the cellophane. As a result, the hackground is etched away on the plate.

The cellophane mask has two advantages over older methods of dropouts (1) Economy the "artist" employed to do this

work requires little skill and does not command a salary such as must be puid to an engraver (2) Better results for most work. The mask is the same size as the original drawing or photograph, and is therefore easier to work with than the halftone negative, which may be a reduction of the original. To opaque the high lights on this reduced negative was a more delicate and laborious

task and by no means so satisfactory.

The latest process cameras eliminate the necessity of making two negatives when the cellophane mask is used for dropouts. The mask is now attached to the original along the left-hand edge, much in the manner of a book page, so that it may set down precisely over the image or be flipped back off it. The picture and mask are now placed in the camera, and a double exposure is made on the stilling the first exposure is of the original picture through the halftone screen. Then the mask is flipped down over the picture and the halftone screen removed, while a second exposure is made. The black parts of the mask protect the negative from this second exposure, but the clear parts of the cellophane allow the light to pass through and opaque the high lights in the negative. These opaqued portions become deeply etched portions in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture, in the metal plate and pure whites in the final printed picture.

Engraving plants still charge customers high prices for these dropouts, although the use of the cellophane mask and the single negative have greatly reduced the cost of the procedure. Picture editors who do not realize how methods have been simplified may behave that the expense is still justified. They can, however, completely climinate the charge for dropouts by having the cellophane mask made in the art department and supplying it to the outside engraver along with the original photograph. They mstead of continuous tone Wherever the high lights should appear, the retoucher now covers the dots with white paint. In other words, he restores to the picture its pure white high lights which had heen given a slight tone by the action of the screen

The velox print goes back to the engraving plant and is rephotographed in line (i.e., without the screen, since there are no longer any continuous tones). The white high lights photograph black on the negative, remain clear in the printing on metal, and are therefore etched out.

4 The Amber Cellophane Mask. A more recent method adopted hy some newspaper art departments, to avoid the cost of dropouts done hy the engraver, is the amber cellophane mask. This is a sheet of amher-tinted cellophane. It is an overlay attached to the print along the upper edge at the hack and folded down over the face. On it, with white paint, the artist paints the actual spots in the picture that are to be dropped out. The reason for using the amber cellophane is that amber will photograph exactly as if it were black, that is, in the engraver's line negative it would be white, while the white spots the artist painted on the mask would he hlack spots in the negative

The engraver can use this mask in a still simpler way. He can lift it off the face of the picture while making the exposure for his halftone negative. Then he can drop the mask over the picture and reexpose the same negative without the halftone screen. The amher (since like hlack it reflects no light) will not affect the portions of the negative to which it corresponds. These are already in dot structure in the negative. But the white spots on the mask will blacken the corresponding spots on the negative three blacks spots will print clear on the metal and he etched out.

5 The Fluorographic High light Process

This, the most recent of all drop-out methods, is the invention of Walter S. Marx, Jr. and is marketed by Esquire Features, Inc., Chicago. We saw how the amber cellophane masked out, or protected the tone portions of the photo during the second exposure in the engraver's camera, allowing the high reflected from the high lights to blacken the corresponding portions of the negative. The fluorographic method is simpler, for in place of the amber cellophane we have a clear fluorescent higher washed or sprayed over all tone protions of the picture. The engraver makes a first exposure through the halftone screen. He follows it with a

second exposure, without the screen, but through a filter which stops all light except the ultra-violet rays. The fluorescent liquid which covers the tone parts of the photograph is a powerful absorbent of ultra violet rays, and consequently reflects none through the filter. The high-light portions of the picture, not heing covered with the fluorescent liquid, reflect ultra-violet rays onto the negative, so that after about a minute's exposure the high light parts have been blackened on the film.

In making wash drawings, the artist merely uses the fluorescent solvent in place of water to mix his paints. For photographs the hest procedure is to airbrush the entire picture with the solvent, then coat the high light areas heavily with Chinese white, which "quenches" the fluorescence of the liquid

The halitone with dropped-out whites makes a much more striking effect and has stronger emotional pull than the picture which shows a dot formation in the high-light areas. It is widely employed today, both in news column photographs and in feature pictures and advertising illustration

The engraver and the artist both have a variety of other methods of enhancing the appearance of the printed picture, though the dropout is practically the only one that is applied to straight news pictures. Methods most commonly employed by the engraver are (1) Use of a special screen in place of the ordinary halftone screen, (2) introduction of a mechanical stipple or technique to modify the pattern produced by the halftone screen, (3) use of a Ben Day film to supply special patterns and shading to portions of the picture.

Methods most commonly employed by the artist are (1) Use of the arbrush to "set back" portions of the original photograph, so that the important parts of the picture will be dramatized, (2) pasting on of Ben Day papers to supply pattern to parts of the picture, as required

# SPECIAL SCREENS

Various special screens are employed by engravers to replace the regular halftone screen for certain kinds of work and for variety of effect. For regular newsphotos the straight halftone is hest, but for photos to be used in the theater pages, the real estate pages, and the society and other departments of the paper the other screens may give results that are very pleasing In wide use is one familiarly known as the "charcoal screen" hecause at each intersection of the lines on the screen a hit of soot has heen placed to him the pattern. A photograph when copied through this screen takes on the soft aspect of a charcoal drawing Real estate editors are very fond of this charcoal screen, which can lend charm to the stark photo of a new house or development. Other departments occasionally employ it too, for in combination with dropped-out whites it can turn an uninteresting calinet portrait into something resembling an artist's soft pencil sketch

Very fine copper mesh screen (like window screen but infinitely finer) is cemented between two sheets of glass to provide another of these special halftone screens. This is known as the mesh grain screen. It gives a result that is harder in effect than the charcoal screen and slightly more mechanical than the regular halftone. The effect is somewhat like that of a picture on canvas or some woven material for the mesh of the screen produces this sort of texture.

#### MECHANICAL STIPPLES

Many well equipped engraving plants have their own set of mechanical stipples or techniques, with which they manage to give striking individual effects to halftones. The mechanical stipple is an allover pattern of extremely fine lines, dots, circles, or crosshatchings which was originally designed and drawn by an artist. The artist's allover design was then used by the engraving plant to make a line cut, and this cut, usually a large sheet of metal about 2 ft square, is filed away to be employed when desired. The engraving plant may have two or three dozen such mechanical stipples on file

They may be used in a variety of ways. The simplest is for adding design or "tone" to certain portions of a simple line drawing as in the case of an advertisment or a cartoon. The cartoon is photographed in the engraver's process camera and a line negative made. The technique or stipple is selected which seems most suitable for the joh, the plate or cut of it is removed from the file, and a proof pulled on glazed paper. This proof is now photographed to obtain a line negative, or it may be copied in halftone for a softer effect. The negative of the cartoon is stripped onto plate glass. The engraver now cuts out of the negative of the stipple pieces of film which will exactly fit the

portions of the picture to be shaded with it and strips them on top of the line negative of the eartoon. When this composite negative is printed on metal the stipple heecmes an integral part of the drawing.

When such a stipple is used in conjunction with a photograph rather than a drawing a slightly different procedure is necessary. It is not practical to attempt to strip the negative of the stipple on top of the negative of the halftone. Instead, the engraver copies the glossy print of the photograph through the halftone screen and copies the stipple in either line or halftone, in exactly the same focus as the glossy. As a result be has two negatives of precisely the same size, and after he has printed the halftone of the picture onto the metal he surprints on the metal the line negative or halftone negative of the stipple. Absolute accuracy is needed of course to insure that the print of the stipple falls precisely on top of the print of the picture. In the finished picture, the stipple pattern will then mingle with the pattern created by the halftone sereen to produce an unusual surface effect.

The stipple is copied in line or in halftone in any of these jobs, according as a hard or a soft effect is required. The line stipple will be more striking but the stipple copied through a screen will have all its fine lines and pattern broken up into a soft dot formation.

#### BEN DAY SCREENS

Ben Day screens are manufactured by a process patented by Ben Day, New York Lach screen 19 a plate of hard clear gelatin on which a pattern bas been impressed, so that the surface is n fine printing relief surface much like that of a halftone cut Some Ben Day screens are the exact duplicates of halftone screens, having the same number of lines to the inch as the various halftones. Thus, a 60 line Ben Day screen corresponds to a 60-line halftone screen. The halft tone screen is not a printing surface, it is a clear glass with intersecting opaque lines forming openings through which light from the surface of a photograph passes in the engraver's process camera, before it strikes the negative The Ben Day screen is a printing surface. The intersecting lines which eross its surface in two directions are raised lines, so that

the whole pattern, though identical in appearance with the half tone pattern, is a relief pattern. When the screen has been highly inked, the pattern can be transferred to a metal surface

In addition to the Ben Day screens which precisely duplicate halftone screens, there are a wide variety of others with patterns similar to the mechanical supples, except that they are in general finer and more delicate

There are many uses for Ben Days The most important are as follows

- 1 To add texture or shading to a line cut. After the line negative has been printed on the zinc plate, the engraver lays a Ben Day screen, properly inked on the zinc, and runs a small roller over it wherever he wishes to transfer the pattern to the metal, or rubs it carefully with his thumb to bring it in contact with the metal and thereby transfer it. This transferred Ben Day design then serves to protect the metal from the etching and and becomes an integral part of the illustration, just as the stipple did
- 2 In combination with holftone Sometimes an effective result can be procured by dropping out the background in a halftone and substituting a hackground in a Ben Day design Or a Ben Day design Or a Ben Day design or a Ben Day sharp to the halftone hackground, to set it back and give greater prominence to the foreground figures, without destroying the background entirely Combinations of line, halftone, and Ben Day are also possible. Here the line and halftone negatives are combined in stripping, as described in the last chapter, and are printed on the zinc or copper plate after which the Ben Day pattern is applied where desired Advertising illustration will employ many more of these combinations than will straight news pictures or even feature pictures. A knowledge of the engraving plant's resources will sometimes enable the picture editor to draw on them in obtaining an unusual and striking, waxes, of "art."
  - 3 Ben Day screens are undely used for color work. The colored comics are produced by this means. Color work will be treated in more detail later. Suffice it to say here that in four color printing a separate cut is made for each of the three primary colors and for black. In each of the three color plates of a comic strip tone is supplied by printing a Ben Day onto the plate to fill in the outlines of the figures the cartoomist drew. The Ben Days used are duplicates of halftone screens. The original drawing has

prohably heen filled in with colored erayon or water color to indicate where the yellow, red, and blue are to be supplied. With his as his guide, the engraver transfers a Ben Day to one of the plates wherever it must print yellow, to a second wherever red should he, and to a third for blue. In so doing he is careful to vary the angle of the lines of the screen for each color, so that in printing they will not coincid. Usually there is a difference of at least 30 deg between the angle of the screen for each of the colors.

The four plates which result from this simplest of all color procedures, if properly inked and printed on paper, one on top of the other, will produce a result familiar to all readers of the comics. The hlack plate, bearing black ink, supplied the outlines, the red plate carnes only a rehef printing surface where the red should be and is inked with red ink, of course. Likewise with the blue and yellow plates, each supplies its own part of the neture.

4 Ben Day pattern may be used for a tint block, by means of which a single pale tint is printed over a halftone or as a hackground for lettering. A regular halftone cut is made and a separate cut hearing the Ben Day pattern. The picture is printed in black and white, and the tint, a pale yellow or blue or some other tone, is superimposed during the printing process. Tint blocks are used widely today by hoth newspapers and magazines.

To summarize hriefly, the engraver enhances the appearance and effectiveness of newspaper pictures by means of special halflone screens used in the process camera at the moment of copying the original, mechanical stapples superimposed on the halftone pattern, at the time of stripping the film or of printing it on the metal plate, and by transferring the pattern from a Ben Day film onto the plate after the picture has been printed on the metal Many of these processes add to the cost of the newspaper cut and the picture editor may decide to employ them only on special occisions. But he still may increase the attractiveness of many pictures by art-department, rather than engraving-department, methods

### ART-DEPARTMENT METHODS

Every art department sooner or later develops a few special techniques for enhancing photographs. The picture editor

should keep a sharp eye on things here, to make sure that what is done to pictures really improves them. Simplicity is always the best rule. Fancy drawn borders, "gungerhread" croppings, and other fine flourishes should be eschewed. He will, however, approve the use of the airbrush to fade out or set back an unimportant or jumbled background and thereby dramatize the action of the picture or the story it has to tell. As a variation of the airbrush method he may find very important in certain cases the use of a Ben Day paper.

A Ben Day paper is a thin cellophane sheet ruled with fine white lines. The artist gums it down to the face of the glossy print or photograph, then cuts carefully around the outlines of the foreground figures and pulls it off these, leaving it covering only the hackground. The part of the photograph under the Ben Day paper still shows through, but is not so bold and strong in tone as the rest of the picture. The photograph, thus prepared, is passed on to the engraving plant, where it is put through the regular halftone process. The hackground tones are all much paler than those of the foreground figures, and the result is a set-back effect.

Instead of fading out the hackground in this manner, the artist may paste Ben Day paper over a single figure, turning it into a "ghost" for an illustration of a Sunday feature on haunted houses. Ingenuity will suggest many uses for Ben Day papers, but good taste and judgment must decide when they are proper to the occasion. Very often they can increase effectiveness of a piece of feature "art".

#### A APPLICATION EXERCISES

- 1 Select two black and white news photographs from any recent newspaper which you believe contribute by selectivity to an interpretation of the news depacted, in something of the way a sonnet or short story interprets an idea in limited space and medium. Be prepared to discuss with specific points and reasoning.
- 2 Select one news picture which you think is mexpertly presented to the point of distorting the news it pretends to report
- 3 Take or select an unpublished photograph of an athleto contest or other news event in your town in which effective high lights would mevitable be converted into pale gray by the ordinary hallfone screen. Explain in detail how these white high lights in your picture could be largely preserved in published reproduction.

- a In the engraving plant, explaining what mechanical effects would result from each treatment, and why,
  - b In the art department of the newspaper
- 4 Using the photograph called for in Exercise 3, take a sheet of white collapsane for it cellophane is not available, a sheet of omion skin or tissue wrapping paper) and fasten it to the photograph in the manner of a cellophane mask. On this mask opaque with black paint or soft lead pencil all portions of the photograph where there is tone, avoiding the high light Explain how a competent newspaper art department would accomplish this and what the purpose would be. Explain the earlier two-negative method and the present one-negative method for making a cut with such a cellophane mask as you have simulated.
- 5 Select a newspicture from a recent paper in which you think a mechanical stypic has been used. Explain how the stipple probably was applied and discuss its effect in the nicture.
- 6 Select from a recent newspaper a picture of which the engraving apparently was made with the aid of a charcoil screen Explain how this screen is made and explain the effects for which it is employed
- 7 Select an advertising illustration or a cartoon which seems to have used a Ben Day sercen or Ben Day paper in reproduction Explain how the Ben Duy serce indirect from the ben Duy serce indirect from the bufftone sercen.
- 8 Select a colored comic strip in which the Ben Day appears to have been used in reproduction. Explain this use
- 9 Select two feature pictures from a recent Sunday paper, in which you think a mechanical stipple, cellophane mask, and Ben Day treatment were not used, but which would have improved the picture considerably, had they heen used Justify your point specifically.

#### B CHAPTER-ORGANIZING QUESTIONS

1 Walter Fater observed that "90 per cent of genius is knowing what to leave out." Remembering is largely forgetting, probably the reason long-past events stand out clearly in our memory is because cluttering details have been forgotten, leaving essentials in bold rehef. This is a reason why use selectivity is an important aspect of art. Many details of a news picture help verisimilitude, but some ranges of color, some dimming back grounds befog the essential news of a scene, befog indeed the essential beauty, rather than enhance it.

With these points in mind, discuss the artistic values which reasonable limitation and was selection in photographic reproduction contribute to the art of news picture reporting Remember, of course, that photography, like every other art form, is a limited medium. Not everything can be accurately depicted with a still photograph. It is doubtful, for instance, whether the rhythm or flow of motion in a hallet can be caught pictorally except with a movie camera. Photographic limitation, on the other hand, is probably far more faithfully artistic than imany critice contend

2 In choosing a method for whitening a background or high light in publishing a picture what business consideration must be carefully taken into account by a new snaper?

- 3 How may the engraver effect a dropout by the use of black paint and without using a cellophane mask?

  4 How may the engraver effect a dropout without either paint or a cello-
- 4 How may the engraver effect a dropout without either paint or a cellophane mask? Why is this method seldom used on a new spaper?
- 5 Explain in detail the two most recent methods used for dropouts
- 6 Explain the improvement in process cameras which has shortened the time required in the cellophane-mask methods
- 7 How are figures allhouetted against a white background by the use of cellophane?
- 8 Explain two advantages which the cellophane-mask method has over older dropouts
- 9 Explain how halftone dots are eliminated in a published picture by the use of a velox print
  - 10 What is a mechanical stapple? When and how is it used?
- 11 Whence the name Ben Day screen? Explain the difference between the surface of a Ben Day screen and the surface of a regular halftone screen
- 12 Explain the uses to which Ben Day screens and Ben Day papers are put in newspaper engraving
- 13 What art-department tendencies should a picture editor guard against?
- 14 What is Ben Day paper? When and how is it used?
- 15 Suppose the real estate editor of your paper brings you a photograph of a fine new home and complains that because of undeveloped grounds and sheer newness, it looks a bit garash What special screen could you order used in your engraving department to soften the effect?
- 16 If your society editor brings you an ordinary cabinet photograph of a very beautiful and socially important society matron explain how you may order a special screen to secure the individuality of an oil painting effect in reproducing this neture.

#### CHAPTER XII

# ELEMENTS OF PAGE LAYOUT, HOW LAYOUT AFFECTS THE ADVERTISER

#### PREVIEW QUERIES

In what way has mereased emphasis upon news photography changed the basis of newspaper page layout?

How do the practical demands of newspaper makeup radically differ from those of advertising or magazine makeup?

Why is newspaper page layout probably due for sweeping major changes?

What specific advantages does the tabloid format possess in modern news presentation? What business disadvantages does it

What practical obstacles would a newspaper publisher encounter in adopting the proposed 15-em column "compromise" between the tabloid and standard format?

The stream of news developments and of picture layout requirements during the day bring a restricting conflict. With what procedure may newspaper executives handle this conflict in order to penalize each as little as possible and still make deadlines and keep the composing room and copy desk functioning smoothly, yet economically.

What five different effects may be sought in page layout from which the publisher must choose?

What specific evidence is there that inside pages are too little read for advertising efficiency, and what can be done about it?

THERE is no subject more urgently in need of clanfication through a recall to first principles than the subject of layout on the newspaper of today. Elsewhere—in the magazine field and in advertising—much progress has been made toward layouts that are effective, economical, modern. Outside their advertising columns, the pages of many of the newspapers in the country present a spectacle close to chaos so far as layout is concerned. The reasons are not hard to find.

The average newspaper is "put to bed" by writing men and printers The former has a mind only vaguely affected by

physical aspects of the page He is conscious of appearance to a certain degree, at least he strives for enough orderly arrangement on Page One to "sell" his biggest stories to the reader. The rest of the paper, daily or Sunday, somehow takes care of itself. The printer likewise is concerned with the appearance of the paper, and he makes his contribution in improved typography. The printer, as a matter of fact, has made his voice heard very strongly in newspaper circles, with all sorts of good results in recent years. There has been a general improvement of the "body type" in which stories are set and of the headline types with which they are displayed. The printer is in a position to improve the makeup of the newspaper page. He may suggest hetter types better spacing, hetter use of column rules or their omission.

Outside the newspaper field great printers and typographers have been deeply concerned with more than mere detail with general form, design, or plan, whether of a poster, an advertisement, or a book page Lately they have been invading the field of the newspaper with insistent advice that "newspaper layout be modernized" Some of this modernization has taken the form of still better typography and still better use of white space and column rules Fortunately some of it has gone much farther than that—to a radical revamping of Page One, using the elements of which it is composed—bead type, halftones, reading matter—in euch juxtaposition that the page acquires strong poster appeal

#### WHAT IS A LABOUT?

A layout is a plan for displaying material usually, for the great est amount of effectiveness (Tigs 22 and 23). In a hook page the material displayed is reading matter in the form of type. In a magazine page, the material may be reading matter and artist's drawings, in an advertisement it probably is a pictorial representation of merchandise, with sales copy and pine. Whatever the material may he of which the layout is composed, the thing to remember is that the layout itself is a plan for visual effectiveness. The physical form of the appeal in the advertisement causes the reader to look, and then to read. Because of poor arrangement the ad may never attract him and therefore never he read, its disordered arrangement may cause him to look but not retain its message, or its clear and subtly compelling form may stamp its message into his mind.

Names Make News!

He Has a
Big Day

Dead At 97

LINDY A Son

Death Takes

Fig. 22—A layout is an organized plan of visual display. In the newspaper its elements are headlines and pictures, and on most pages text type and advertising. Note how this layout leads the eye down the page while temping the reader to open up the paper.

After all, good layout in advertising and in hook and magazine pages is a simpler problem than layout on newspaper pages can ever he In all these, the material of the layout is fairly static. The artist who sits down to map out an advertisement knows definitely what is to go into it, and so does the man who plans a magazine page This particular merchandise—or this particular fiction story or magazine article—is to he displayed Illustrations can he ordered and blocked off into fixed spaces on the dummy Display and hody type can be fitted into the general plan

The newspaper man makes layouts for material which is much more fluid. He works under pressure of deadlines and runs the chance of seeing his best plans scrapped at a moment's notice for a variety of reasons a hig story breaking, new pictures arriving, late ads that have to be forced into the pages. He must often make aloyout decisions in a trice that men in other fields might mull over for hours or days. He must frequently do the job in his mind which other men have time to work out on paper. He is called upon to be a mental acrobat in a field shout which he frequently knows nothing—small wonder that his performance so often turns out to he nothing hut a few awkward and ineffective 'stunts'. These stunts become the newspaper way of doing things, and the student or new comer learns and copies them

To improve new spaper layout we must return to fundamentals. We must he sure we know what the materials of our layout are, and what we are trying to do with them. The average newspaper layout is composed of reading matter, headlines, and halftones of news photographs, with which material must be included on many pages advertisements and cartoons and other drawnos.

Page One is of course the 'show window' of the newspaper, and as such is apit to receive more attention than any of the others. Yet it is also the page which must be put together most hurnedly, and changed most often. A well known typographer tells the story of a young woman who followed him into a newspaper composing room and, after watching him direct the work of putting the front page together, said. "Do tell me, what do you think about geometrical makeup?" He shot her a withering glance and curtly advised her to "Forget it!" Later he used the incident to mark his point that all talk about layout is overdone. You have a certain number of stories and a certain number of

pictures that must go mto the page, and, so he felt, you just do the best you can with them

His point of view illustrates a partial truth which often passes as a whole truth Obviously, front page news is not going to be shoehorned into a preconceived geometrical layout, yet most papers have always recognized the need for some sort of a plan for Page One The sort of plan that was formerly used has been made worthless by the increasing space occupied by news photographs Front-page "balance" formerly relied on a design ereated by the arrangement of headlines The larger and darker head type spotted the page To make these dark spots of head type fit into a pattern, stories were conveniently lopped off, or jumped to an inside page The New York Times had its charactenstic V makeup above the fold with the bottom of the page as gray as possible Important heads were placed to make this V pattern while below the fold only small heads were employed Other newspapers used arrangements of heads to form an X on the page, or a diagonal line of heads, from right to left, or left to right Some preferred "borizontal makeup," with several long heads cutting across the columns To make the dark spots of head type more effective, bigger and better heads were written Two or three lines of large boldface type were followed by several banks or decks of a smaller size, bigger and blacker than the body type in which the story itself was printed. These complicated heads and decks, which often gave a complete resume of the story, were intended as much for the reader's eve as for his mind They provided the weights with which the page was spotted

Try to fit a few newsphotos into one of these old layouts and you will know why they have virtually disappeared You may also understand why the obsolete forms of heads-with-many-banks are giving way to the simpler "streamline heads". The fact is that pictures now provide the first important factor in spotting that news pages require. The visual effect of type units must work with and not against them.

Format of the newspaper page seems destined to change Though page size varies considerably today, the average page is approximately 17½ by 23½ m, which is folded in half on the presses. Despite the fact that the reader finds this large size unwieldy for reading purposes, publishers are hesitant about

adopting the tabloid formit \ \textbf{\text{1et}}, to quote one of our greatest typographers, Douglas C McMurtne

If a typographer thinking along modern lines were asked to advise on the formst of a metropolitan dath, he would recall the creed that form follows function and namediately cut its page size in half, wirestitching the finished product on the press—an entirely feasible operation

The function of the newspaper is to present news to the reader, and few can doubt that the reader could take it more conveniently from the tabloid size paper. There are of course many reasons why publishers do not immediately follow such good advice Conservatism holds them back from effecting so radical a change in a paper whose appearance has become familiar to readers over a long period of years. There are also more practical considera-tions. The advertiser who now pays for a full page display will perhaps buy only a tabloid page—or half of what he now uses—if the format is reduced in size. This might be taken care of by raising the advertising rates, but where there is a rival paper in the same city which continues the large-size format, the publisher may hesitate before making the move If the advertising and business-office difficulties can be ironed out, he will eventually realize a saving on the cost of paper stock and on labor Tabloid size ads, paid for at better rates, will require less paper less editorial columnage to balance them, and therefore a sharp decrease in composing room and even in editorial costs. Cer. tainly the smaller size will prove more convenient to the news paper reader

Expense is an urgent problem on practically all newspapers today Quality is of necessity sacrificed to quantity, because the newspaper is in reality giving "too much for the money." Low grades of newspirit are used, and often they all but annul the appeal of news photography Universal adoption of the tabloid format by publishers might make possible expenditures for better grades of newspirit and so bring the whole solution of the problem of newspaper appearance more nearly un-to-date

It seemed proper to say a word about page format as a preface to any senous discussion of modern page planning because format will profoundly influence layout Problems of displaying material on tabloid and on large pages are very different Many feel that the large format gives more chance for display of both pictures and stories. Yet it is a fact that the folded newspaper on the newsstand shows no greater area than does the tabloid Historically the large format was an outcome of early taxes, not of reader requirements, just as Page One makeup based on arrangements of 1-column heads grew less out of a search for graphic display than out of a lack of mechanical facilities permitting headlines in wider measures.

The folded paper presents problems of display that often are not correctly solved. A newsphoto must be placed so that the part which "tells the story" is above the fold, or it loses its meaning, yet the page when opened out must be well balanced and effective too. Tabloid format has its own set of obstacles. Banner lines in large-size type give a very brief word count. Many of the best photographs of news events are "horizontals" (that is they are greater in width than in depth), yet the "upright" picture is better fitted to be displayed on the tabloid front page. This difficulty presents itself most urgently when the news picture is so important and dramatic that it becomes worth the entire front page. In one instance the New York Daily News met the emergency by giving the newsphoto the whole front and back of the tabloid. The Hindenburg disaster was displayed in this fashion.

Each format has its appropriate layouts Possibly the inevitable trend to the tabloid bas been no more clearly illustrated than in the recent effort of the Hearst newspapers to adopt a "quarterpage layout" on the front page This was based on the fact that the reader of a large newspaper folds it to a fourth its size while reading Page One was accordingly divided into four units, each of which, when the paper was so folded, would show a complete story or picture

Many have predicted that a sweeping revolution of format is not far distant, even for the most traditional newspapers. An editor of the conservative New York Times declared recently that he foresaw his paper would be a tabloid within the next five years. In The Changing American Newspaper (1937), Herbert Brucker, calls attention to the possibility of a format between tabloid and large size. The following is reprinted by permission of Columbia University Press.

We now have just two newspaper formats the normal size and the half-sized tabloid Why? Standardization of presses and mechanical

equipment, yes, advertising mats and syndicated material based on the 12-em column, paper sizes and all the rest. Nevertheless newspaper page sizes are accidental offshoots in what happened before, rather than products of a conscious attempt to meet the needs of contemporary living conditions.

Has any publisher in a competitive situation considered how his circulation might benefit if he printed, say, a newspaper balfway between tablied and standard size, with 15-cm columns set in 10-point type, with a layout based on in consideration other than producing a paper that would be desired and eagerly hough? There are, to he sure, ample material difficulties in the way of such a venture. But granted that the end is desirable and profitable, when has it sufficed in this country to point to obstacles, shrug nine's shoulders and go on in the same old was?

Professor Brucker's idea is interesting. Such a format as he proposes would obviate the necessity for a folded new spaper and would permit a better play for newsphotos and greater poster value for the front page. Any newspaper, however, which pioneered to this extent would risk heavy losses in advertising since both national and local advertisers furnish mats and electrotypes of ads for standard column widths and would be apit to stee clear of so difficult an advertising medium, even if the change were otherwise made possible. On the whole, however desirable such an in hetween format might seem, it could scarcely he realized without the definite agreement of a large number of papers to adopt it simultaneously. At present it seems much more bleely that the regular tabloid format will gradually gain the ascendance.

Later in this book types of layouts suitable to both large and tabloid pages will be considered in some detail. Right here one observation should be made. Tabloid layout utilizes less space and must do so more economically. Hit or miss methods which get by with the large format will not do so well with the tabloid, which more nearly approximates a magazine page. Ineffective photography will look more dull in the tabloid, and poor judgment in the play of pictures may prove more disastrous. For this reason it is perhaps as well that the evolution of newspaper format should wait upon the development of more skill in handling netures.

We have said that newsphotos "spnt" the modern newspaper page, providing much of the display and balance that were once attained by arrangement of heads It follows that modern news paper layout springs almost directly from our use of newsphotos

On the front page the play of the news, plus the play of the newsphotos, determines the layout. The elements out of which page is built are headlines and hody type, pictures and entilines. To these, as a constant element in Page One planning, must be added the newspaper nameplate. The rigidity of this fixed unit—the nameplate—its typographical appearance, and the space it must occupy sometimes seem a hopeless stumbling block to modern layout with strong reader appeal. The nameplate probably does in most cases occupy too much space. Yet its importance cannot be minimized.

On inside pages of the daily size and shape of ads and the play of ads are first considerations in planning, and newsphotos and storics should be so arranged as to create an effective whole Getting the reader to read the inside pages is the real problem We shall consider it later in some detail

On Sunday feature pages, pictures are very often the predominating factor in layout. On daily picture pages and on Sunday rotogravure pages pictures with their explanatory captions are the whole maternal out of which the page is built

Pictures then, are a vital element in newspaper page planning We may use pictures singly, or we may use them in groups which we term picture layouts

# PAGE LAYOUTS AND PICTURE LAYOUTS

The student should be careful to avoid any confusion in his thoughts between page layouts and picture layouts. A newspaper page layout is a graphic form of instructions to the printer or makeup man, indicating to him excetly how the type matter, halftone cuts, and advertising are to be put together in page form. A page layout is expressed on a dummy—a white sheet having the same proportions as the newspaper page but usually scaled down to small size, with perpendicular rules to indicate columns. When a picture layout is included in the page layout, its size and shape will be indicated on this dummy.

A picture layout is a grouping of pictures. In its practical sense it is a preparation of picture copy for the engraver. Newsphotos may be cut and pasted down exactly as they will finally appear. If preferred, they may be eropped to indicate what part

of each picture is to be included, and then a separate layout drawn up showing how they are to be combined. This serves as instructions to the engraver. When the picture layout is for a full page, it may he made as a single piece of metal, in which case the layout is a guide for the engraver and no layout is required by the composing room. Such a full page picture layout may also be made in the form of separate cuts, with captions set into it in the composing room. In this case a page layout must be furnished the printer as a guide in putting the page together.

Page layout and picture layout are too intimately related to be handled separately On the front page, they call for conferences between the picture editor and the news editor or whoever dummies the front page for the composing room Obviously, it is impossible to allot space to stories and order headlines written and set, without knowing what important pictures must go on the page and what space they will need It is as impossible to send through pictures to the engravers, without knowing what the news editor considers the biggest stories of the day and how he thinks they should be played. When the two have agreed on the size of the art that is to be ordered for the page, the news editor blocks this in on his page dummy in proper relative size. He is then prepared to order heads for his big news stories and otherwise plan his page around this art If he ordered heads without knowing precisely what art there would be, be might find that most of them would have to be reset later to fit the page course front page makeup is so fluid that the arrival of a new picture that is very dramatic or the breaking of a big news story may eause an immediate revision of plans, resetting of heads, and scrapping of cuts that have been made or canceling of orders to engravers No matter how often the page is revised, size and form of art must be determined before a page dummy can be properly planned

On woman's pages, society pages, and sports and other inside pages of the daily, mattention to the fact that pictures and advertising are the physical starting point of the page dummy prohably costs newspapers buge sums of money annually. An editor frequently has his stones in hand hefore he has his pictures or can learn what ads will appear on the page. It is important that he get these stones through to the composing room to be set, for if he holds them up the printers will not be able to handle them.

in the last rush hours. He scans each story with an eye to its importance and marks it for a bead according to its worth Later the pictures arrive and he orders cuts according to the value Still later he gets the ad specifications and so attempts of these to dummy his page but finds that the headlines, ads, and art do not work together, so at the last minute he sends through suhstitute heads, causing double labor on the head-letter machines If these heads have to be rewritten at the main copy desk of the paper and if they come through at the time when news copy is flowing, they may be delayed so long that they have to be set in a rush at the time of making up the page. When a number of editors make a practice of handling the matter of page planning so badly the composing room will maintain a larger regular staff to accommodate them, and so, probably, will the copy desk Things appear to be running smoothly, but economy is ignored

A far better procedure for these daily feature pages would be this Begin a regular flow of copy to the composing room as early in the day as possible, and keep the copy moving. Do not let it pile up awaiting pictures. Cut the copy to the length you think each story is worth, with a probable play in mind for it. Thus, you may have a story which will be the lead on the page, another which will be a second lead, and several other shorter stories. Mark these stories "HTK" (head to come). They will go to the copy desk to be read, and the proofs in the composing room will bear the slug for page and story, plus this indication, thus "Woman's, Dress, HTK".

Keep a basket with earbons of all stories, and stamp every page across it with a red stamp Carbon so that there will be no danger of the text being reset. As soon as you have your pictures and can plan your art in relations to your ads, take up these earhons, mark them for beads, and send them through to the copy desk without delay. As often as possible the earbon will be handed the copyreadies who read the story originally, he will write a head, send it through to the composing room, and destroy the earbon or keep it on a file (but will not send it to the printers). Galley proofs can be used for this purpose when they are available, but the ordering and writing of heads should not be held up a waiting proofs from the composing room. Also, the proofs will be needed at the time of making up the page, so unless a duplicate set is furnished it will be better to hold onto them.

#### EFFECTS SOUGHT IN PAGE LAYOUT

Layout, we have seen, is the display of material for graphic or visual effect. Before the reader reads, he sees and reads to the physical appearance of the page before him. Even what he thinks after he has read is subtly influenced by the nature of the display. In laying out a page, then, we must have in mind not only our materials, but the nature of the reaction we want from the reader. This will differ widely for different newspapers and for different sections of the same paper.

On a front page we may wish to impress the reader with the

- That here is a dignified, scholarly, complete, and accurate coverage of events.
- 2 That here is a hrisk, lively, clean minded paper which is reliable but not stodgy,
- 3 That here is a sensational coverage of big news, crime, and human interest stories,
- 4 That here is dramatic coverage of the biggest story of the day, every day,
- 5 That here is a news guide, easy for the well informed reader to keep up with

Our materials may be the same, but we use them differently according as we wish to produce a feeling of sound confidence, up-to-date progressiveness, seasuousness, boldness of vision, or thoroughness 

Each type of presentation has its following only the publisher can decide which he prefers 

It is up to the layout to produce it

On inside pages, the general nature of the newspaper's appeal must still be kept in mind. Here another factor enters into the problem advertising. Unless a newspaper can produce page layouts which get the advertising read, it may find itself without revenue. Little attention has been devoted to this hy publishers and managing editors, hy picture editors and news editors and others dealing with page layout. Advertisers, however, are frequently aware of the bad service they get in this respect, and it may account for the fact that many of them are turning to other mediums.

Dr George Gallup, Director of Research of Young and Rubicam, Inc , and head of the Gallup Survey, says

The number of persons who read a substantial amount of the editorial matter on inside pages of our typical metropolitan newspapers is appallingly low. In one study of Sunday newspapers, it was found that only one person in three had read anything on the average black and white page carrying display advertising. In the same study it was found that the best read news story, picture, or feature below the fold on pages carrying display advertising attracted only 13 per cent of all readers of the newspaper.

In the daily newspapers, the situation is little better. The typical news story, or feature appearing below the fold on inside pages, seldom is read by 10 per cent of the readers of the newspaper.

Even assuming that one's advertisement gets placed next to reading matter, the opportunities for reaching a very large proportion of the readers of the newspaper is decidedly slim.

We have developed a nation of front-page readers by the simple practice of placing, or at least starting, all news of any importance on page one of our newspapers and by using the inside pages, in many instances, for dump pages and for material regarded and treated by editors as of relatively small importance.

I am not arguing that front pages should be made any less interesting, but I am arguing that more editorial thought be given to the problem of making every inside page as attractive and interesting as possible.

The makeup of inside pages unadvertently works to keep the readers' attention centered at the top of the page. Typically, all the most interesting stones, features, and pictures appear at the top of the page Examine the inside page of a metropolitan newspaper and you will discover why so few readers ever bother to read anything below the fold

I believe that a different style of makeup is called for, one which will make the page more readable and interesting to the reader and one which will not penalize the adjusticer.

One of the reasons for the weakness of inside pages of the newspaper is the mental attitude of the "writing man" risen to be news editor or makeup editor or even managing editor. Often such a one has no appreciation of the graphic arts and an inimical attitude toward the advertising which "crowds out" his good stories. He is not picture-conscious, he is not layout-conscious, and he is mentally ad-resistant. He is determined to ignore in so far as possible two-thirds of his raw material.

Page layouts must he huilt out of all the material—reading matter, pictures, and ads—so arranged in relation to each other as to obtain a maximum of reader appeal. We shall return to a discussion of this problem when we are better prepared to study ways and means of laying out inside pages effectively. The poorly planned inside page is a drain on the newspaper owner's pockethook. It costs him more to set and print hecause of wasteful handling, it costs him circulation through lack of reader interest, it costs him advertising by failure to show results.

When we turn to the many different sections and departments of the Sunday paper, other than the general news section, we have an increasing number of page layout problems. If we leaf through a metropolitan Sunday paper we discover that some of its pages are primarily informational, others are there for circula tion purposes in that they cater to the interests of certain groups of readers, still others have a purely entertainment motive, and, finally, there are those which exist to draw certain classes of advertising, to back up and strengthen advertising appeal

The purpose of a page has much to do with its style of layout A section devoted to scholarly articles on the hackground of the news, economics, and politics, requires dignity of presentation A Hollywood feature page requires gay, lively appearance Society pages should carry some of the glamorous effect that the word "society" implies Fashion pages should be smartly modern in appearance

Prohably the dullest of all layout work is to be discovered in the real estate, travel, and other special sections easting primarily for the advertising. These include such occasional special sections as Automobiles, Homemakers, Radio, that are printed only once or twice a year. Such sections are largely the work of the advertising solicitors, who have been husy long in advance of their printing, signing contracts for ads. The pictures are often furnished by the advertisers, and much of the copy as well. Once the ads have been placed, cuts and copy are worked into the pages with much more concern for getting them all in than for creating attractive layout, yet good layout might double or triple their "pulling power," and the advertiser has to this extent been imposed upon

To sum up, newspaper page layout is a problem of graphic presentation of reading matter, pictures, and ads Its form is affected by the character of the reader appeal desired It relies for its results on typography that is suitable, pictures or picture layouts that serve the desired end, and proper harmony between typography, pictures, and advertising

#### A APPLICATION EXERCISES

1 Rule an 8 by 11 sheet of copy paper into 8 columns to represent a layout sheet. Take a current issue of the New York Times and lay out the front page on your layout sheet in such in way as to be interesting and coaveniently readable to a reader on is subway, who wishes to fold the paper into a quarter page shape in the crowded car. Try to preserve also an attractive makeup for the new page when viewed as upper and lower half sheets, and also when spread out in full.

2 Select some current metropolitan newspaper outside of New York or Chicago With another 8 by 11 layout sheet, replan the layout of any one of the usual nages to increase its graphic presentation for reader interest

3 Take a current issue of the New York Times On a layout sheet remake the front page, using, if necessary, news from any part of the paper so as to present "a sensational coverage of big news, crime, and humanisterest stories," assuming that such might be the aim of a nublisher

 Romake an inside page of this same issue of the New York Times so as to conform with the sensational makeup policy of your hypothetical front page in Exercise 3

5 Take a recent assue of the Denver Post or of any Hearst newspaper available and lay out a front page, using the news of any part of the assue, to present "a dignified, scholarly, complete, and accumte covering of events" Strye, however, very definitely for readability and reader interest

6 Remake any inside page of the paper used for Exercise 5, presenting a makeup harmonious with your proposed front page, 3et striving definitely for reader interest

7 Take news from any one or two recent metropolitan newspapers and lay out what you consider an ideal frost page and an ideal inside page for a paper that is "brisk, lively, clean-unided, reliable but not stodgy" (Read Exercise S before solving this problem)

8 For your front page in the exercise above, assume four bypothetical news pictures of the news used. Either make these four pictures into a layout, or use them in two groups or as four separate pictures, and explain low in your makeup they "spotted" the page. Write overlines and under-"lines for your netures.

9 Reader interview studies atrongly auggest that the left-hand column of an editorial page and editorials or editorial features which appear below the fold are the levit read parts of the page and that editorials at the other columns two and three are most widely read, regardless of subject matter or style.

With this is mind, lay out an editorial page, using the material which appears on any editorial page of a current issue of a metropolitan paper. Try to make this editorial page so graphically presented that all parts of it will attract reader attention and jet preserve reasonable dignity.

# B CHAPTI R-ORGANIZING QUESTIONS

1 Why probably has newspaper page layout lagged behind newspaper typography and the enhanced reader interest of news and feature content?

- 2 Why do special editions, which carry unusual amounts of advertising, often impose upon the advertiser in the result?
- 3 Distinguish hetween a page layout and a picture layout
  - 4 What is the primary purpose of any newspaper layout?
  - 5 What are the physical materials of newspaper layouts?
- 6 What two conditions in daily newspaper procedure work against conformance with a fixed geometric plan for page makeup?
- 7 What changes in newspaper emphasis have altered the former principle of front-page halance?
- 8 What visual relation should be maintained between type units and news pictures?
- 9 What is meant by the principle of art, 'Form follows function ? Does this principle favor the tahlaid or the standard size of newspaper?
  - 10 Give the names of two books by Douglas C McMurtne
- 11 What result might the change to tabloid size have upon the users of full page advertising? What problem would it present in the writing of hanner heads?
- 12 If publishers should come to agree that there is sufficient ment in 15-em columns set in 16-point type presented in a format halfway between tabloid and standard sizes, what would one publisher among them have to do before making it practical to adout this change for his newsmaper?
- 13 On inside pages of a daily newspaper, what is the first consideration in planning the makeup from the standpoint of the husiness office?
- 14. On woman's, society, and aports pages, what makeup materials constitute the physical starting point of the page dummy?
- 15 The Montreal Star was the first newspaper in North America to develop to a high degree of reader appeal the makeup and coverage principle of dramatic coverage of the higgest atop, of the day, every day "Explain in some detail what you understand this principle to he (It is much more than using a day hanner with 2-column "hreak" in 10 point).
- 16 How do society page layouts frequently fail to live up to the principal reader interest which the word "society" implies? In what way is this true also of fashion pages?

#### CHAPTER XIII

# CLEMENTS OF PICTURE LAYOUT; KINDS OF INTEREST AND DISPLAY

#### PREVIEW QUERIES

In recalling large news pictures or several pictures published in a layout, can you distinguish between what picture editors call "simultaneous effect" layouts and "centralized interest." layouts?

Can you distinguish between the effect and use of a "sustained interest" layout and a 'progressive interest" layout?

Remember the last half-dozen news pictures you saw published?
Would you describe their impression on you as one predominantly of
communication or of decompany?

What is there about our human makeup and experience which causes us to be sensuine to balance or lack of balance in a building, room furnishings, or a picture layout?

What would you understand to be meant by the expression "safe halance"? "Dangerous balance"? Which do you find more arresting to look at?

Can you recall a news picture layout which suggested motion, not with respect to the content of the picture, but with respect to the pattern of the layout?

What four forms of movement can you see in the physical world which have counterparts in picture layout patterns?

Suppose news pictures arranged in the form of a straight band across the top of a pige appear with the left-hand picture narrow, the next wider, the center picture widest, the next like the second, and the fifth as narrow as the first. What form of motion in the physical world does such a brount success?

NLWS pictures are communication, not ornamentation. We no longer use them to dress up pages, but we use them toget a message over swiftly to the mund of the reader. An actor putting a thought across the foothglits injects into it a dynamic quality, a motion and driving force which will carry it over and without which his words will fall dead in this feet. The same dynamics are needed in the newsphoto layout if it is to tell its story to the reader's eye, and not just mumble it. The graphic arts axiom that "form follows function" ambles as well to the

picture layout as it does to the whole newspaper page. A picture, or group of pictures, may be only a part of the page, but they are the part on which the eye at once focuses. They are therefore the greatest instrument in producing reader reaction to the page.

The editor who orders a picture layout has a definite idea of the effect he wishes it to produce upon the reader — There is a variety of effects at which a picture alone, or a picture layout, is aimed

Most important among these are

1 Simultaneous Effect The purpose of this effect is to strike directly at the reader's emotions with a bold, unified dea—horror of disaster, pathos of bunger and poverty, fury of lynching, triumph of a bero. The simultaneous effect is sought when the purpose is to more deeply as well as inform. It is the single blow between the eyes which to use a slang phrase, is meant to "hook the reader cold". It is the big spotlight. This single sharp dramatic effect may be obtained by using only one newsphoto—the right one, of course—blown up large enough to dominate the page. One compelling picture of a burning steamer, an airplane crash, the bombing of a city, carries stronger emotional appeal on the front page of a paper than a group of smaller pictures could ever do. It is rightly the method most often employed for big news on Page One.

Another form of smultaneous layout which has high emotional value is the photomontage, in which a number of striking newsphotos are cut and fitted together or otherwise combined so that they form just one unit. Each individual shot contributes something to the total effect of the photomontage, but in such a way that the whole creates a single impression on the reader's mind Photomontage takes time and skill, and for this and other reasons it is better suited to other parts of the newspaper than it is to the front page.

2 Centralized Interest This type of layout usually conveys information and almospher rather than strong emotion. The picture that "takes the spotlight" tells the story of an event—the signing of an important hill by the President, the dedication of a local monument—and the pretures grouped with it are needed to provide color and hackground. The event picture must dominate the provide color and hackground.

nate, so that the reader's eye takes in the story first then passes

on to the others

The centralized interest layout is also indicated for the per sonality story told with pictures, and in this case it conveys to the reader's eye personality and background. The picture in the spotlight is, say, that of an actress who is in the news, in a candid shot which is blown up large enough to permit the reader to eatch something of her personality. The pictures grouped around this central one may show her at golf, in her dressing room, or promenading with her pet poodle, and the layout as a whole will strive to reveal what manner of persons he is

Centralized layout must not become confused By the word centralized we do not mean to imply symmetrical arrangement, for this would seldom do, but we do mean that one picture in the layout carries the central theme and the others must be sub ordunated to it. Usually, only two or three subordinate pictures will be used, and their arrangement involves no sequence

- 3 Sustained Interest It may happen that a single picture cannot he selected which tells an event properly, but several pictures grouped together will do so This may be hecause of the character of the event, the nature of the pictures themselves, or the failure of the cameraman to get a shot which tells the story There are several popular winners, or opponents, in a political race, or a local concert will feature three Metropolitan opera stars and a famous violinist, no spotlight interest is inherent in such ideas The event may concern an airplane crash, and the photos that have been serviced are all inadequate in dramatic values, yet several of them grouped together tell the story where no one of them could stand alone It is the opening day of school and the cameraman has brought hack a feature series taken at various school huildings, but the whole group is needed to make it the story of opening day The news of the day is represented on a daily picture page by an assortment of shots of many different events In all these presentations the sustained interest of the render is desired
- 4 Continuous or Progressive Interest Layouts known as "continuities" are much in vogue. They are pictorial exposition take written exposition, they may carry a high emotional content, but their purpose and function are to explain. How an automobile is made, how women's fashions originate, how a child spends its day in our city slums, how the city gets pure draining water these and a million other subjects make good picture continuities.

They helong on picture pages, in Sunday rotogravure, and in the picture magazines—practically never in news pages

The problem in the continuity layout is to catch the reader's interest, then give him a detailed account through pictures Generally his interest can be captured with one dramatic shot played much larger than the rest Once his eye is attracted to the layout, he must be able to follow readily a sequence of smaller shots, which do not vary too greatly in size and which are so arranged that the thread of the exposition runs naturally through To aid in this the pictures themselves, or the captions under them, are frequently numbered This is preferable to confusion, but is not always necessary Every feature subject is not a subject for a continuity The picture editor may have hefore him a fine group of shots of children at local playgrounds, of local society matrons in their gardens, of office workers hurrying home in yesterday's cloudburst. These are often roughly styled continuities, but they are ideas which require no explanation and involve no progression. They are sustained interest layouts, variety of size and shape will add to their appeal, and they should not be numbered, since there is no sequence

Before deciding what general type of layout to employ, the picture editor must know what his purpose is Is it to cast an emotional spotlight on a hig news story? Is it to inform and interest? Is it to explain? According to the answer, the same group of photographs might conceivably find their way into a photomontage; a centralized layout, a sustained interest layout, or a picture continuity. The editor, say, has spread out before him photos taken in and around a great steel plant, and he is debating what to do with them Before deciding, he considers the circumstances

1 A labor battle has taken place outside the plant, and ten men have been killed in the fighting. He wants to stun the public with the idea of violence. He chooses the most startling picture and gives it the big spotlight, alone, on the newspaper's front page, referring the reader to an inside page or to the daily picture page, where the best of the remaining pictures are used for a layout with sustained interest. Later on, in a Sunday feature reviewing this same event, he may obtain a new and smashing emotional effect by working the same pictures into a photomontage depicting the horror of labor conflict.

- 2 The workers in the steel plant have just signed an agreement with the owners. Here is a picture of the president of the company and the labor union chief bending over the contract. The shot is news, and must be given an important play, but it may be wise to group some of the other shots around it to lend color and atmosphere.
- 3 Yesterday's paper carried the story of righting around this plant, but the public is still interested. No smash emotional effect is possible, but the best pictures, grouped together, have a sustained interest that makes them worth using on an inside page.
- 4 Peace has been restored for some time in these steel mills, but the present group of pictures were taken because the public, reading daily stories about steel workers, have become interested in the story of steel. They want to know how the great steel girders for our bridges and skyserapers, the rails over which our trains ride, the chains that hold our great ships at anchor, are made. The picture editor selects a series of shots which explain the open-hearth process or cable making, or chain making. He can find in this one subject alone material for several fine continuities. He may put over the idea of mass violence in a photomontage. But he does not use the photomontage to tell the story of steel, for it cannot give a progressive explanation. For the latter it is necessary to have ample caption space and an orderly arrangement.

Different kinds of layouts, then, serve definite functions, and it is a mistake to believe that they are interchangeable. The experienced man chooses the layout that answers his purpose hest.

#### DISPLAY IN THE PICTURE LAYOUT

So far we have considered certain types of layouts which answer specific needs, but we have mentioned form in layout only in n very general way. The artist punting a picture thinks of form as the subtle balance which exists between the virious elements in his composition. The man designing a poster or an advertisement knows that the manner in which he displays his malerials, belaneing white space with reading matter, or type with illustration, will determine the power and effectiveness of the appeal

Picture layout has its own methods of achieving balance and display, but they are very similar to the methods of the poster or ad Considered from the standpoint of display, there are only two possible forms of picture layout the symmetric and the asymmetric They differ simply in the kind of halance they achieve This is strictly in accordance with all the rest of the graphic arts

What Is Balance? Balance, in itself, is a property of the natural world in which we live, to which the human eye has become irrevocably devoted. It is a sort of visual assurance that things are not going to topple over. We glance at a sky scraper, and, despite its loftiness, we sense in its visual proportions that it will not be dashed to earth hy the power of gravity. Furniture, the clock on the mantelpiece, all the useful objects of everyday living, provide us with this same visual assurance. If halance does not exist in something the eye lights upon, we feel unhappy and insecure. We subconsciously resent the lack of it, even if there is no real danger. On the other hand, we are so accustomed to balance all around us that we are apt not to notice it at all, so long as it is undisturbed.

If we see balance which is both true, yet delicate and precarious, we feel instantly surprised and thrilled. The learning tower of Pisa is more amazing than a skyscraper. The ice queen who glides on a single shining toe through maneuvers that resemble the flight of a bird gets far more attention than a heautiful woman standing still. We like to see the laws of gravity "almost defied" but we are very unhappy if they are really disobeved.

There are, then, two kinds of halance in the natural world, and two kinds of visual balance in layout safe balance and dangerous balance Both are correct, the latter is far more arresting

Symmetric Layout The symmetric layout has vertical balance If a vertical line or axis is drawn through its center, the shape and pattern of the part of the layout on the left of the line will be the same as the shape and pattern of the part on the right.

Symmetric picture layout is static in effect and is only suited to pages where the subject matter requires great dignity of treatment. For this purpose it is often good hecause it suggests calm dignity and authoritative writing. It insures the readers' confidence and respect, and, if only used where appropriate, it can provide a healthy contrast with asymmetric layout on more lively pages. Opposite editorial pages and the pages of serious comment in the Sunday paper frequently make use of it.

Symmetric layout has the firm balance of an architectural design. Its appeal is the silent appeal of the handsome building façade, substantial and rehable. It does not, however, have the "pulling power" of the asymmetric form.

Asymmetric Layout Tbe asymmetric layout has its axis off center. It has balance with motion, and this is precisely the quality that is sought in the best poster and advertising art. Of course the papers of the country are full of picture jumbles which have their axes off center, yet have no balance, precarious or otherwise. The beginner may wonder how he may know when the right result has been achieved. There are those who will try to give him rules for it, but be will find these are not practical. He has a rule within himself in his instinct for visual equilibrium, and the more he relies on it the better trained his eye will become

Tolmer, French author of Mise-en page, a book which made listory in the advertising field, likens asymmetric balance to the art of the tigbtrope walker "It cannot be expressed as a purely mathematical calculation," he says "The tigbtrope walker steadies herself with her parasol rather than with the aid of a formula" Feeling is the best guide to the rightness of a layout of newsphotos. In a simple grouping of two or three pictures, oblique feeling is the quality that gives life and motion. Where pictures are separated by type in a page layout, we may achieve the kind of balance known as the "principle of the steelyard," a large weight near the fulcrum balancing a small weight at the end of the beam. The equilibrium of a very large picture and a quite small one, in right relation to each other, can be most effective.

When we discussed the essential qualities of newsphotos earlier in this book, we found they were personality value, news value, and action Cameramen go to all lengths to get action within the photograph In grouping newsphotos into layouts, we must always bear in mind that action layouts make the surest appeal

Variety in Asymmetric Layout Nobody gives any particular attention to the flagstones in a pavement, the brieks in a building Nor does anyone bother to glanee at the pictures on a Sunday society page which week after week comes out with the same tiresome arrangement of circles and squares or oblongs and ovals Many a newspaper picture layout is so usual, so dreary and dull and everyday, that it represents an investment without returns

to the publisher. On the other hand, we must not seek the hizarre in layout on news pages, for exaggerated effects would detract from the appeal of the advertising and would not work into the general page plan.

Layouts for inside pages on the daily must usually consist of very simple asymmetric arrangements of two or three pictures so placed as to balance advertising. Where the advertising runs strong, any layout may be too much, yet a single newsphoto may be effectively placed. Tilted pictures may give a feeling of motion on a feature or fashion page, and the white space created by tilting will enhance the action value. "Give your layout more air" is a bit of advice frequently heard, and it is not without meaning.

On sports pages and woman's pages of the daily we can always give imagination a little looser rein than elsewhere in the paper but nowhere should we admit duliness or monotony as the solution of our picture problems. We may have to run the heads of five local businessmen, but we can find a better way to handle them than as a straight strip of five 1-column cuts. Monotonous layouts make a dull paper that nobody reads or cares about

Column Widths Important One "monotonous detail" of the daily paper we must adhere to rigidly, that is the column width If we plan layouts that break into parts of columns, type will bave to be reset to fit around them, and this is impossible under rush conditions. No matter what arrangements we decide on, the outlines of the layout must break even with the columns, except in the case of a mortise that can he used as a caption space.

In planning most of the Sunday pages this rule will also have to be observed. Sunday magazine and special feature pages often can disregard it. If the layouts are planned far enough in advance the type can be set in odd measures to fit around the pictures. Here is a problem that the editor must discuss thoroughly with his composing-room or mechanical superintendent, so as to know what layouts may gain the variety of a freer form.

### UNITY IN PICTURE LAYOUT

The reverse of monotony is variety and contrast. If all the separate pictures in a layout have the same size and shape, it becomes monotonous, even if we get away from the static

arrangement of these "building bricks" To achieve contrast we crop the various pictures to different sizes, and perhaps to different shapes, always of course, being guided by good taste

Now, if we are making a layout of a number of pictures, and we vary their sizes yet keep them all pretty close, we will discover on looking our layout over that there is something radically wrong with it. It appears disordered. A layout in which nothing predominates lacks unity. It is like a regiment of soldiers scattered over the field without a commander. If we choose one picture—the most striking if possible—and give it a large spot, the whole aspect of the layout changes. It now "hans's together."

Any full page of pictures, such as a daily picture page or roto page, needs a dominant picture or a dominant shape, to give it unity. Even a layout of two pictures is apt to be more interesting if one is larger and one smaller. If there are as many as three, one should dominate, unless all are fitted into a shaped layout

Sometimes a daring unity can be achieved in a picture group by the mechanical method of striking a white or black line across the layout to emphasize its direction and hold the separate pictures together or by giving the picture group as a whole a strong directional sweep. Strong lines of head type cutting across a layout or jutting into it may give it a unity it did not have in itself and completely remove the monotony of several pictures the same size and shape. It must always be kept in mind that head type spots the page just as pictures do, and that it can be tied into a picture layout effectively to create pattern. Unity then, depends upon dominant picture of dominant pattern.

#### SHAPES FOR PICTURES

In making up a layout, shall we crop every picture a different shape, for variety—some in circles, others in squares, still others silhouettes of the human figure that lope nimbly across the ingenious pattern we have devised? Many an editor does just that and really feels he bas achieved something because the leg of the bathing girl swings nonchalantly across the sking scene in the Alps, in his layout for the travel page, or because the fist of a senator has been outlined with white ngainst a strike scene

We get a lot of variety in layout that is plain bad taste. The worst of it is, it costs money to do these amazingly ugly jumbles of

odd shapes and silhouettes. They call for expensive engraving The best shapes in which to crop pictures are those suggested by the simplest geometric forms. Among these, the circle and the square are the least interesting. The oblong, whether used horizontally or vertically, has more interest because of the variety inherent in its dimensions. Oblongs mortised into one another gain variety of shape and serve also to tie the layout tog ther

Shape, in a picture layout, may be approached from two different points of view. The individual pictures may be cropped in contrasting shapes, such as ovals, trapezoids, obloigs, and triangles, and then assembled into a whole, or shape may be a motter of the layout as a whole, and the individual pictures may be made to fit into this shape, once determined upon. In the second instance, it is interesting to observe that every group in pictures fitted into a layout of predetermined shape is not a photomontoge, although many on newspapers regard it as such. The true photomontage is the group of pictures which produces a snaglo unit impression on the reader's eye, communicates one thought

Layouts which show variety in the shapes of their individual pictures and those which mold all their pictures to a given shape can both be effective if properly employed. The layout with variety of individual shapes probably owes its appeal to this foctor rather than to a sense of pronounced motion in the layout as a whole. The method is suitable to large in small layouts. There is, however, a danger that the shapes chosen fight each other instead of working together. Too many shapes in the same layout will produce a sense of wild confusion. Some editors seem dehberately to strive after this very thing, on the assumption that it gives the feeling of "trashness" to their display which will attract readers who like sensation and lack tast. Yet even sensation can be more effectively resented than by this method.

Layouts with separate shapes must keep these harmonious. The best way of doing this is not to choose shapes which are too dissimilar. Straight him forms such as oblongs, triangles and trapezoids work better together than they do with circles and ovals. Even the most discreet combination of ovals and oblongs has a "Victorian gingerbread" appearance to the modern eye. There is a place in layout for circles ovals and ellipses which we are about to discuss. For the moment, let us remark that modern feeling searcely tolerates them in the layout which bases

its appeal on variety of picture shapes and uses as well straightline forms

# LAYOUT WITH PATTERN

Much of the hest modern layout achieves unity by the second method described that of molding the individual pictures to a general pattern and outline. There is a reason for this. The greatest feeling of motion can be achieved when the whole picture mass "moves" in a given direction. When such a layout is surrounded by the gray of type matter on a printed page, its effect can be almost startling. For this very reason it is better suited to feature pages than to news pages where it may detract from advertising. In full page picture layout, one unit of the page may have pattern and the rest of the pictures provide a harmomous background, as, say, a broad diagonal band cutting across the page. A layout with bold pattern is apt to create white space and this should not all be filled in with type. White space is important, otherwise the layout will not move as we intended it to do.

The danger in a layout with pattern is that the editor has first conceived of a form for it, then backed and murdered the poor pictures to make them fit Newsphotos must be cropped with respect for their internal pattern of outlines. They must be cropped so that what each one has to say is not injured The wrong way, therefore, to do a layout with pattern is to decide on the form of the layout, then look for the pictures do this, we may be obliged to pass up the best pictures because they refuse to be cramped and nammed and distorted into our mold The right way to proceed is to find the best pictures avail able for the layout idea we have in mind, then spread them out before us and, by studying them, wait for the pattern idea they may themselves suggest Good pictures have a way of whispering layout ideas to the wise editor And sometimes they do not whisper-they yell In no other manner are bold, smart layouts born

What Kind of Pattern? The form we are seeking for the patterned layout is one which suggests motion. The newspaper which ran a group of pictures in the form of a mammoth candle on its anniversary front page was not producing an example of fine layout. It was merely doing a stunt. Stinits grow tiresome if repeated often, but motion in the pattern of a layout is invariably interesting

Motion in layout takes its hunches from motion in the everyday world. Go out and look around you, and you will discover there is

- 1 Motion in strught lines
- 2 Motion in an arc, the wlole or part of a circle,
- 3 Motion in an ellipse,
- 4 Motion in wave form

You will find the counterparts of all these forms in the best layouts in modern publications. The first gives the straight diagonal arrangement of pictures, or the layout with strong diagonal feeling.

Layout in the form of an arc, or portion of a circle, has two advantages—It suggests motion, and, when the circle in its entirety would be one extending fir beyond the borders of the page it leaves it to the imagination of the reader to complete the geometric image. This "unfinished" quality is what gives strong appeal to any art, for it draws the audience into the performance providing action and insisting on reaction.

The cliptical form of layout, with its ends to the edges of the page has this same unfinished quality and great adaptability as well, for the artist can vary the curve of the clipse to sunt page requirements, space and pictures

Rhythmic or wave motion in a layout must be of a broad generous kind, not the gingerbread scallops with which artists once adorned the edges of their newsphotos. These were inteaded as ornamentation and were distracting. Photos may be arranged to suggest a wave line when a number of them are combined in a good sized layout. The wave line, running off the page, has the same unfinished quality as the are or ellipse, with the added notion of rhythm.

The idea of rhythm may be secured otherwise than by a wave line. A full page may be horizontally divided into hands of unequal width suggestive of rhythmic motion, and these may be entirely pictures or alternate bands of pictures and type matter (Fig. 23)

A picture layout across the top of a page in the form of a straight band may be so divided by perpendicular lines as to

Fig. 22.—There s rhythm and strong emotional pull in these alternating bands of head type and newsphotos. The page is designed to self! the paper, and to lure the reader into inside pages which carry ads as well as important news stories. Readers who stop with Page One are a cause of poor advertison results. suggest rhythm The rhythmic wave may be either whole or half In the first instance the picture on the extreme left of the band would be narrow, the next wider, the center picture wides, the next like the second, and the fifth as narrow as the first, completing the wave More is left to the imagination if the crest of the wave is at the extreme right, each successive picture from left to right increasing in width

In all his approach to patterns for picture layouts, the newspaper artist must keep his feet firmly on the ground and his head somewhat below the clouds. He is not seeking amazing page decorations, hut merely strong, dynamic ways of talking to the public with pictures. Weird and complicated shapes and outlandish presentations have no more place in the paper than have fine phrases and flourishes in the reporter's story. Simplicity is always right, but it can be simplicity that is dynamic and purposefull it need not be stumdity.

#### DIMENSION IN LATOUT

If the reader will refer to the chapter in which we discussed the copy values of newsphotos, he will recall that one of the things we were most anxious to obtain in a picture was the "three-dimensional factor". The eye is accustomed to seeing things in the outside world, not as flat surfaces, but as objects having depth as well as length and hreadth. Light, producing contrasts of tone, was the agent, we noted, which gave us this three-dimensional illusion within the picture.

Today, dimension is coming to he recognized in layout as well as in photography. Advertisers have been using three-dimensional display for a long time, type designers have invented several interesting dimensional type faces which are very popular Magazines are giving a third dimension to many of their illustrations, and slowly, newspaper picture editors are beginning to think about it too.

Methods of obtaining third dimension are so easy and the result so effective that it seems worth while to give the matter careful thought. A newsphoto may be made to appear as if mounted on a block by the simple expedient of painting a wash border around two sides of it, or it may be given a "shadow" by the rapid use of a crayon pencil. More will be said about this technique in the next chapter.

Sometimes it is necessary to use a photograph of a document or of a handwritten letter in a newspaper layout, and the threedimensional treatment will greatly enhance its effectiveness. In general, newspaper picture work has been too flat, and it might be well to watch for the opportunities which may present them selves of giving it three-dimensional appeal.

#### TEXTURE IN LAYOUT

Carlier in the hook we discussed many methods of enhancing the halftone cut by dropping out the whites, by using special screens and Ben Days In planning layouts, the picture editor may discover that he can increase appeal of a group of pictures by the use of special "textures" Often he can make a photograph serve where formerly the newspaper hired a portrait artist or fashion artist to do the job, provided he has this knowledge of textures at his command

A photograph of a prominent man or woman, if reproduced with a charcoal screen and dropped-out whites, will look very much bke an artist's charcoal sketch. If a copper mesh screen is employed by the engraver, the result will look like a portrait done on canvas. Fashion "drawings" may be secured by enlarging fashion photographs made in local shops, to page length if desired and then reproducing the figure as a cutout or silhouette, with special screen and dropped-out whites. Thus engraving devices may be made to realize economies to the newspaper and increased variety in the appeal of picture copy.

# A APPLICATION EXERCISES

1 Procure copies of six different issues of two or more metropolitan papers which use pictures extensively. Chip, paste, label, and bring to class for discussion, examples of the following layout effects simultaneous centralized interest, sustained interest, and continuous or progressive interest. If you are certain that any one of these layout effects is lacking in your collection of papers imagine a concrete example of the lacking layout and describe it on a sheet of paper.

2 Assume that your paper has just won a 5-jear campaign for a municipal water softener against political opposition. News of the proposed instal alton has been printed with spot pictures of the signing of the contract etc Describe one or two continuities which you, as picture editor, might send a photographer to get to appeal to a broad interest which doubtless has been aroused by your paper's campaign and the news of its victory.

- 3 Clip a picture Isyout which lacks unity, giving the effect of confusion Explain how, by eliminations or rearrangement or both, this layout might be improved.
  - 4 Clip two lay outs which show good unity of effect
- 5 Clip a layout which illustrates symmetric balance—what advertisers and artists often call "bisymmetric arrangement" Explain in writing where the axis of balance lies.
- 6 Clip two examples of asymmetric layout, often referred to as "occult balance" Explain where the axis of balance is here, and what actually constitutes the balance Explain whether or not motion is suggested by these basuate.
- 7 Clip an asymmetric layout which you feel is extreme and hizarre Explain why this is not good
- 8 Clip or describe two asymmetric layouts which attain interesting variety and avoidance of monotony but which still are in good taste

#### B CHAPTER ORGANIZING QUESTIONS

- 1 Explain how the art principle of "form follows function" can apply to picture layouts as well as to the whole newspaper page
  - 2 What is a photomontage?
  - 3 Why is photomontage usually unsuited to the front page?
- 4 What kind of sustained interest layouts are sometimes mistaken for an upublished as continuities or progressive interest layouts? Why should sustained interest layouts not be numbered?
- 5 Explain what asymmetric balance in a picture layout is and how a picture editor should train himself to recognize its proper attainment
- 6 Explain why the effect of depth in a picture layout is important and explain two ways in which it may be achieved
- 7 What practical limitation does the column width factor in newspaper mechanics place upon the neture editor in deviang levent?
- 8 What is meant by the expression, 'Give your layout more air"?
  Describe an effective instance of following this advice
- 9 What can be done in planning layouts for Sunday magazine and special feature pages which cannot, for practical reasons, be done as a rule on news pages?
- 10 What mechanical method can be employed in a picture group for achieving unity?
- 11 In cropping pictures to secure variety of shape in a layout, what caution must be observed?
- 12 Should the form of the Issout be determined before or after the pictures for that Issout have been selected?
- 13 What is meant by "a picture layout with a pattern '? Distinguish between a stunt pattern and a valid pattern
- 14 What is meant by rhythm in a layout pattern and in what ways may it be attained?
- 15 How may certain layouts be given added appropriate appeal by using special "textures "?

#### CHAPTER XIV

# MECHANICS OF PICTURE LAYOUT, METHODS OF PREPARING COPY

#### PREVIEW QUERIES

What tools does a newspaper picture layout man use?
Under what conditions may a picture editor send two or three
photographs to the engraver without drawing up a layout even when
he intends to have the pictures published according to a layout plan

he already has in mind?

What is the advantage of pasting pictures down to form a layout

before sending them to the eagraver of

Why is a pastedown layout usually made larger than the position it is to occupy in the printed paper?

What is a mortise in a picture layout? What practical consider ations in new spaper layout control the size and dimensions of mortises? How is a camera lucida used in making layouts? How is transparent paper used in making picture layouts?

VER1 simple equipment is needed to prepare a newsphoto layout for the engraver. The layout man uses a drawing board, with T square, triangle, and ruler. Usually he employs a logarithmic table to help him in scaling pictures or scales them by the simple method described in Chapter VII. In his worktable drawer, at the right of his drawing board, will be found hard and soft pencils and charcoal pencils, a mechanical drawing pen for ruling lines that are to be reproduced by the engraver (these serving merely as guides are drawn faintly in pencil), a speed ball pen with which he can also draw lines of even thicknes, and perhaps struight no e pens for hand lettering. His dividers will serve him for many purposes, and his beam compass will be indispensable for drawing large circles. He will have on hand large sheets of good-quality white Bristol board for drafting his layouts and a large prid of transparent tracing paper.

The paints he employs are opaque water colors known as "showcard colors". For layout with ordinary new photos only Chinese white and lampblack are needed, these are combined to

tones of gray Camel's hair brushes in varying sizes will ided for use with these colors, and in many cases the artist ux them to the tone he requires and apply them with the sh

#### LAYOUT WITH SEPARATE CUTS

he simplest form of picture combination, where only two ce photos are used and none of them require enlarging or mg, the artist may find it unnecessary to draw up a layout e engraver, although he himself has it in mind. In such a is merely indicates on the backs or margins of the glossy how they are to be cropped and mortised, so that the result-parate cuts will fit into one another as he desires. Thus the ter will not see what the final pattern is to be, but the plantal pour must be carefully given on the page dummy which to the composing room. Each glossy print will hear a er or a slug and the same number or slug will be written the picture is to appear on the page dummy. The separate ness will then be fitted into the proper pattern by the 10 man.

advantage of this procedure is that it often saves expense, so the small cuts entail no waste of metal in the engraving as an irregular layout may. The irregular layout seed for at higher rates. The disadvantage of separate cuts they seldom fit together quite so neatly as if they had heen in a single piece and if one of them slips during the stereog process the result is a had looking job. If the pictures are to be fitted together to form a strip or rectangle, no ving costs are saved and it is hetter to paste the prints down her, so that the engraver can make them into a single cut

# PASTEDOWY LAYOUTS

r the pastedown layout a large sheet of white Bristol hoard acked to the drawing board with thumbtacks at the upper is The position of the card is trued by sliding the T square upper edge to make sure that it is horizontal

r a full page layout an oblong having the same relative nsions as the newspaper page, not including margins, is cod off with hight pencil lines Vertical lines may also be by drawn to indicate columns In other words, a page thimmy is outlined on the Bristol board, in accurate proportion but usually a little larger than page size. The artist must know what its relation to actual dimensions is or he may produce a layout which is impracticable. Page size for this purpose is the measurements of the page in the metal form in the composing room. Dimensions must not be taken from the printed newspaper, as there has been slight shankage in stereotyping. Check with the printer to get sizes right.

If the layout is for a page where columns may be entirely disregarded, it is better to disregard columns, for these only interfere with freedom. If any advertising is to appear upon the page then column widths must be taken into consideration.

Most of the pastedowns made for the daily are several columns wide (but less than full-page width) and a third or less of the page in depth. The artist decides whether his glossy prints need enlarging or reduction, and accordingly determines on a measure which will represent the width of a column and draws lines on the Bristol board to indicate the number of columns he requires If the measure he chose was twice actual column width, then the layout will have its total width halved by the engraver, and the whole layout will thus be reduced to a fourth its pastedown area If the column widths on the Bristol board are octuol dimension, then the layout will be neither enlarged nor reduced engraver will take the peneiled column lines as his indication of the number of columns required and will focus his process camera to obtain a halftone of that number of columns in width, allowing the depth to take care of itself. Of course the artist must keep the final depth in mind, or he may produce a piece of art which cannot be used on the page Usually the artist uses large glossics and makes the layout on a larger-than-actual-size scale, because reduction will sharpen the prints, hide retouching, and refine all the work he has put on it

In the pastedown, prints are not merely marked with crop marks. Each print is cut with a sharp knife to the desired shape and pasted in its proper place with rubber cement. This procedure probably ruins it for further use in the newspaper. Therefore, if it is a shot which may be wanted again and if the new spaper does not have the negative, it should be copied and a special print made for the pastedown. Here the supervision of the picture editor

will prevent waste. Some pictures will never be wanted again and are not worth copying, but others that come in from the news picture services are valuable additions to the picture morgue and ought not to be lost through careless use in pastedowns.

The whole pastedown layout can he enlarged or reduced in the engraving process. If the separate prints are not in the proportionate sizes to each other that the layout man desires, then he must ask for new prints, enlargements, or reductions before he goes to work. He may indicate with crop marks a portion of a print which is all he desires to use, then have the photographers copy and enlarge this portion only, giving him a print of a specified size to fit into the pastedown.

The layout as planned may show a combination of pictures which leaves mortises of less or of more than column width These need scrutiny Perhaps they will make suitable spots for captions or cutlines of the layout and does not need to he filled, or perhaps the layout meeds to be revised hecause these are really awkward "holes" A mortise of less than 6 picas in width is too narrow to carry cutlines. A mortise over a column wide, and not too deep, may be a good spot for cutlines, but if it gets to a width of over 18 picas, the layout man must remember that small type is hard to read in wide measure and should have this factor of his problem well in mind

If the mortises at the bottom of the layout are of column width, or multiples of a column, they represent no problem because stories and headlines will fit below them naturally. A story with a 2-column head will slide up into the 2-column mortise, a 1-column mortise, a column head and another with a 2-column head will fill the 3-column mortise. Page planning with such a layout is greatly facilitated, and for this reason the artist is usually careful to see that the lower edge of a small layout does not show mortises in odd measures which cannot be filled

The pastedown method is often used for photomontage, sometimes fairly successfully, sometimes crudely, with white lines separating photos that have heen cut and tortured into position. The best photomontage is one which blends all photos indistinguishably, to produce a unit impression (Fig 24)

### PASTEDOWN LAYOUT WITH INSERTS

In making his pastedown, the artist may be pushed for time and may wish to use one of the photos either larger or smaller than the print that has been furnished him but may not have time to ask the photographers for a new print. In this case he pastes down the other glossies, but where the missing print is to go he paints in a solid black area on the Bristol board, representing the exact space to be filled by this print. If the entire picture is to be enlarged or reduced to this area, the width and length on the layont must be proportional to the original print. The artist may indicate with crop marks on the print that only a portion of its width is to be taken in and that a portion of the top of the picture is also to he cropped away but he cannot determine the precise cropping of the picture as to both width and depth, unless he has scaled it very accurately to make sure that when enlarged or reduced it will precisely fill the area allotted to it in the lavout

When such a layout goes to the engraver, he photographs it as a whole. He then copies the insert picture, focusing so that the portion between the crop marks will give the width of the insert, as indicated by the black area on the layout, and taking in as much of the picture as is necessary to give the depth indicated for the meert. In stripping the film onto the glass, this insert negative is stripped into its proper place with the rest.

The pastedown layout is used where refinement of art work is desired, and for this reason the insert is a makeshift rather than a proper procedure. If the artist has all the prints before him in their true proportional sizes he is in a better position to turn out a fine job. The effects he obtains may be only those of careful darrangement of prints that are light in tone and others with much darker tones, so that halance and harmony are secured. He may paste them with edges touching, or he may leave narrow white spaces between them. He may crop one into another or crop two prints as matching semicirles, which pasted close to each other form a single circular shape in the layout. When all his pictures are pasted down he may give the layout direction or motion by cutting a very narrow channel across the layout with his kinfe removing the narrow strip of glossy to leave the white Bristol hoard. A white line produced in this fashion is finer and

Art work by S F Perkins

Fig 24A—Photomontage, step one Several photos, preferably separated in the layout are pasted in position on Bristol board. Their edges, and areas where other photos will appear are airbrauhed with lamblack, with persons for a certain amount of overlapping when the remaining pictures are in place. The result is reproduced to obtain a large-

Fig. 24B — Photomontage step two Several more photos are pasted down on a second sheet of Bristol board ruled to the same outside layout dimensions and are then handled according to procedure described under step one Measure each picture with a ruler and note that it is larger than the space available for it in the final photomontage permits overlapping and blending of the images

Fig. 24C—Photomontage step three. The remaining pictures for the layout are pasted down on a third sheet of Bristol board authorished and rephotographed as already described There are now three large glossy prints corresponding to A B and C. These prints are used by the photoegraver to produce a single halftone negative by means of three successive exposures on one film in his process came.

cleaner than one which might be painted on with a camel s-hair brush

Many newspapers still employ pastedowns with rules drawn in India ink to serie as ornamentation and to "tie the pictures together". The New York World-Telegram is a good paper to study for this effect, which it uses on most pages. The lines are finely drawn and the ornamentation so slight as probably not to distract attention from the halftones. Nevertheless the modern mood is away from this sort of thing. Present-day taste is inclined to demand that the halftone tell its story with a minimum of "prettying up" and that layout effects be achieved by bold cropping and juvitaposition of prints rather than by any fanciful additions. It is just a return to the first principle that the best art accomplishes its effect with the greatest economy of means.

If layouts are used at all on the front page, they are usually kept severely formal. The reason is that too bizarre a play of pictures would distract the reader's eye from the news headlines. On feature and on inside pages layout ideas have more leeway. Here a striking method of eropping, a geometric arrangement, a nice contrast of tone values, or a bold method of achieving balance of weights within the layout, with a sufficient amount of white space, may make all the difference between a layout that attracts the reader's eye to the page and one which he literally new er sees

#### ALL-INSERT LAYOUT

Often the artist must prepare very hastily a layout which includes a number of pictures. The prints he has are not in the proper sizes, some require reducing and some enlurging for the hest play of the picture material. He would like to take just the central figure of this one and blow it up to three times its present size. This other print will stand reduction to a fourth its size, etc. He therefore draws up with penel a layout having the precise dimensions of the final art work and indicating precisely the final outside measurements and mortises of each separate photograph

On the back of the photographs (or on their face with Chinese white) he indicates approximately the eropping of the picture which he desires and which he thinks should result in mortises of the right dimensions, but he leaves the niceties to the engraver

Fig. 24D—Finished photomontage. Each of the three glosses was placed in identical post on on the copy board of the photoengraver a samers. A nech exposures eaveril mages were registered on the negative but the lamphlack mashed the negative elsewhere. As the pictures overnm their space double exposure occurred around their edge. This photomontage ran as front page of the Special Articles Section of the Washington Post Sunday December 23 1938. It carried the caption Peace on Earth Goodwill to Men.

When the engraver copies each print in his process camera, he focuses to obtain a picture with the exact dimensions for which the layout sketch calls, even if in so doing he must take in a slightly larger or smaller area of the picture than the crop marks indicate.

He then strips all the separate negatives onto the plate glass, with the layout as his guide. He cuts the various films away to the mortiese called for, and if he is necurate in his work the layout should fit together as neatly as if the artist had done a pastedown job. Like the pastedown, the whole layout will then he made as a single piece of metal

Offhand it would seem that this procedure was cheaper and faster than the pastedown it tecrtainly takes less of the arist's time. It takes less of the time of the photographers too, for they are not called upon to make enlargements or reductions of the pictures to he used. It avoids the necessity of cutting ty valuable pictures which may be needed later on but which must he fitted into the pastedown. However, do not forget that the engraver is a high salaried technician. Whether the newspaper has its own engraving plant, or whether it uses an outside firm, it will pay more if it allows the work on its layouts to he done by the engraver rather than hy a staff artist. The picture editor should know what the relative costs are in his town.

Sometimes a large layout, such as a daily picture page, should not he made as a single piece of metal, because it is desirable to remove some of the early pictures on the page and replace them with later news pictures in the various editions of the paper The artist will in this case draw up a layout similar to the one just described He will scale every picture and crop it with light pencil lines on the back, showing the exact position of mortises Where there is enlargement or reduction, he must be very careful that he has allowed for it in the mortises, otherwise his cuts will not fit together His layout should show dimensions in inches of each cut, 1 e, hreadth and depth where these are greatest, and hreadth and depth of each mortise Then, if he has made any mistake in cropping which would throw the page out, the engraver will he apt to rectify it in making the cut Each cut in such a layout will be a separate piece of metal, and a dummy must therefore he furnished the composing room so that the page can he put together Each picture will bear a general slug which

indicates it is for the picture page and a number or letter corresponding to a number or letter for its position on the dummy Thus a picture slugged Pix Pg (1) will go in the spot marked (1) on the dummy When substitutions for such a page are sent through for later editions, they must be for fixed positions in the layout A cut 4 m wide by 6 m deep with a 2 hy 2 mortise in the lower right-hand corner can be replaced only by one which measures the same and has the same mortise

#### SIGHTING THE DIMENSIONS

An experienced man does not always need to scale a large print carefully to discover what its dimensions will be after reduction Suppose he has a print before him which measures 81/6 by 11 in It shows a central figure of, say, a nder on horsehack leaping a hurdle He wants to show this figure as large as possible, hy cropping off some of the print at each side, but he also must reduce the picture to 4 m wide

With his painthrush he puts crop marks on each side of the figure on horsehack, as close as he thinks advisable puts a crop mark above the figure. The width between the crop marks at the sides will be reduced to 4 in hy the engraver The artist lays the picture on his hoard and holds above it his ruler He closes one eye and moves the ruler closer or farther from the print, until the 4 in on the ruler exactly cover the width hetween the crop marks Then, keeping the ruler at the height at which he has it, he turns the print around on the hoard so that he can measure it lengthwise He now sights the length, from the top crop mark to a point at the hottom which includes the essential parts of the picture Say 6 m on his ruler cover this, that means that 6 in is a sufficient depth for the picture when reduced He puts no further crop mark on it, but sends it through to the engraver with instructions to make a 2 column cut, 6 in deep, as cropped If the picture is part of a layout he blocks in a space 2 by 6 in to take care of it

"Sighting" is often the easiest way of fitting a large picture into a layout If, on the other hand, the artist has a rather small print and wishes to enlarge it in his layout, he may simply lay it down on the Bristol hoard with the top and left edges where he wishes them to he in the layout, then lay his ruler diagonally on it, from the upper left-hand to the lower right-hand corner At any

point along the diagonal marked by the ruler he can mark a dot and complete the oblong, which will have the proportions of the neture when enlarged

# SIGHTING WITH A CAMERA LUCIDA

The modern well equipped art department may be provided with a simple but amazing little instrument called a "camera lucida," as a help in making complicated layouts. A good one will cost about \$30, though there are very much cheaper ones on the market The camera lucida is clamped to the edge of a table on which the Bristol board for the layout is placed It consists of a thin vertical rod and crossarm which extends over the layout and which holds a small lens in the form of a prism. When a photograph or drawing is held in front of this lens at a short distance, the lens reflects it onto the layout, so that the artist, looking down on the Bristol board through the lens, can with a pencil trace out the whole picture or any part of it he desires to use By moving the picture farther away or closer to the lens he can get a reflection on the layout which is a reduction or an enlargement Seeing it exactly as it would appear, he is better able to decide how to crop it or combine it with other pictures If he wants to use one figure out of a photograph and silhouette it in his layout, he can sketch onto the paper the exact shape of the silhouette in any size he decides is good and then proceed to group his other pictures around it The camera lucida has a magnifying glass which can be inserted to procure still greater enlargements, and it permits the artist to try out many different layout combinations with ease A silbouetted figure drawn into a layout in this fashion serves as instructions to the engraver, who makes a silhouetted halftone of the proportions indicated

The instrument can be useful for many layouts which combine charcoal drawing or other sketches with photographs. It can increase the artist's speed and originality in handling many kinds of layouts, including those for advertisers, which are often handled by the newspaper art department as well. In using the camera lugida it is convenient to have an upright stand or frame to which photographs and other art may be attached with thumbtacks. This can be placed on the table and moved back and forth so that the artist can study the effect of enlargement and reduction of pictures.

#### LAYOUT WITH TRANSPARENT PAPER

A sheet of transparent tracing paper is often a great help to the artist who is making a large layout involving a number of photographs which must be enlarged and reduced and cropped into one another. The transparent paper is the same size as the Bristol hoard. It is laid over the Bristol board, on which the dimensions of the layout have been outlined and thumbtacked with it to the drawing board. The outlines of the layout are traced onto it.

The artist then selects a photograph which he thinks would look well in the upper left hand corner of the layout. He raises the tracing sheet and fits the picture up into the corner of the outlined frame. Then he pencils onto the tracing paper the outline of the picture as he wishes it to appear. He can crop or mortise it hy simply drawing his line around the part he wishes to use, he can enlarge it by placing his ruler diagonally across it and marking a larger corresponding oblong on the tracing paper, he can mark a cropping first, then enlarge this on the tracing paper.

When he has allotted to the first picture the space he thinks hest, he withdraws it and takes up a second and slides it under the tracing paper. He may decide to place this one lower on the page and let its upper left-band corner mortise into or cover an uninteresting lower right hand corner of the first picture. He therefore outlines an oblong on the tracing paper which cuts into the first oblong. Now be bas an unfilled space above his second oblong. He looks for a picture which would do for this spot, proceeding as before, until the layout is entirely filled.

As each picture is withdrawn from under the tracing paper it is marked with a number or letter or slug to identify it and the name is written on the paper and later copied onto the Bristol hoard. The artist hlocks in caption spaces with each picture and must not forget that these are an essential part of the pattern, and that their positions must be such that the reader sees at a glance to which picture each caption refers

When the whole layout has heen completed on the tracing paper, the artist goes over it with a pin or the point of his compass, sticking this into every point where two hores intersect, so that the Bristol hoard below will be perforated with a small but visible pinhole. He now removes the tracing paper. By ruling lines between the pinholes on the Bristol board, he will reproduce

the layout In so doing, he modifies to the extent of showing the outlines of the pictures as they will appear when mortised into one another, leaving out the extra lines where the oblongs intersect Most rotogravure pages are laid out with tracing paper in the manner just described

#### A APPLICATION EXERCISES

- 1 Clip from a metropolitan paper two groups of pictures for which no formal layout needed to be made Indicate what instructions probably were put on the photographs of this group when they went to the engraver On a sheet of paper show what instructions probably went to the makeup editor which the engraver did not see
- 2 Either select five 5 by 7 punts or cut five 5 by 7 rectangles of coppaper to simulate prints, indicating on each paper a line or two describing hypothetical pactures for a carbolized utiental layout Assume that you are going to use one "spotlight" picture larger than the others Make a 6-col umn pastedown layout on Bristol board, indicating mortises for cut-lines Indicate what the exact depth of the cut made from this layout will be
- 3 Suppose that, in making the layout for Exercise 2, you have one print which needs to be enlarged before you can use it in its proper proportion in the layout. Assume that you have insufficient time to wait for an enlargement to be made. Indicate with an extra piece of paper what you would do shout this, without delaying delivery of the layout to the entraver.
- 4 Suppose you wish to make a layout in which all the prints to be used need to be copied in different dimensions. Make a layout for an engraver, indicating instructions for each of three hypothetical pictures, which would not require your waiting for new prints to be made.
- 5 With eight photographs, or pieces of paper cut to simulate photographs, prepare a 6-column progressive interest layout on Bristol board with the use of transparent paper.

#### B CHAPTER ORCANIZING QUESTIONS

- 1 List the materials which the newspaper picture layout man needs 2 When individual prints for an intended layout are sent to the engraver without being accompanied by a layout, where must the intended layout
- be indicated?

  3 What disadvantage is there about grouping separate cuts?
- 4 If certain prints to be used in a pastedown layout with cropping may need to be used again and the negative is not on file, what can be done about it?
- 5 How may direction and movement be given to a layout with the use of a knife? In what way is this method superior or inferior to the use of a brush?
- 6 In what situation is a pastedown-layout with inserts indicated? Explain what happens in the engraving room when an insert for a layout is called for
- 7 Explain precisely how dimensions of a print may be fitted into a layout by sighting with a ruler

#### CHAPTER XV

## TYPE IN LAYOUT, STANDARDS OF TASTE, MODERN TYPE TREATMENTS

#### PREVIEW QUERIES

What modern change in taste finds response in the comparatively recent Tempo, Vogue and Metro type faces?

In recent picture lay outs you have seen, how do the headlines and underlines succeed or fail in directing the eye or framing the layout?

How may news heads of the same column width he arranged on a page so as to avoid a static effect and contribute instead to a diagonal feeling?

Since an attractive picture layout will help absorb the dull appear ance of unbroken gray type which may surround it, what five simple devices may an editor use to liven his page body type?

Examins a picture layout on a printed page Do you think the underlines should be in light or in boldface? Should the overlines be in as large type as the main news or feature heads on the page? Why?

Look for a few underlines for single pictures or layouts which are not centered immediately under the pictures flush right, in a mortise, in a half-edumn measure bevide the cut, or double printed on the picture. What superior or inferior effect do you feel there is in these instances to an orthodox placement under the cut?

HOWEVER satisfactory a picture layout may be in itself, its final appeal for the reader will be determined by the manner in which it is combined with other elements on the page, with headlines and hody type, with the overlines and underlines which complete the story the newsphotos have to tell

An expert typographer may consider printed words only from the standpoint of the heauty of the design of the letters which comprise them. A writer may consider words only for their meanings and he misensitive to heauties or crudities of type design. A layout artist may see words only as dark and light blotches on the page, spots of gray and medium gray and hlack tone that create a pattern for the eye, which works either with or against the nattern of the halffone cuts

The picture editor may be neither a great typographer nor a great writer nor a great artist, but he must have some knowledge of all these things and he must learn to respect words for all three of their values For cutimes that are badly worded, type that is hadly selected, and pages that are not well "snotted" will cancel his hest picture effects It is not the purpose of this book to deal with the subject of typography except to point out some of the essential relations of type to pictures

#### EMOTIONAL VALUES OF TYPES

Just as halftone reproductions of newsphotos speak to the reader through tone values which tell him a story and play upon his feelings in one way or another, so type has emotional values too Some letter designs are as elegant as a gentleman in tails others as rugged and rough and wholesome as a man in overalls Some types have the streamline swiftness of a high powered airplane, others the deheavy and refinement of a society helle Advertising designers are very careful, if they know their trade well, to pick the type which has the right emotional value for the merchandise they are displaying

The newspaper layout man is much more restricted in his choice of type faces than is the advertising man His paper probably has its headline style and headline type rigorously determined No great leeway is or should he permitted here. The problems of type that arise will be matters of modification and adjustment, selection of cutline faces that accord with heads hetter arrangement of type on the page, etc Many newspapers today usc Bodom headline type, others use the equally beautiful Goudy, and still others are adopting a type dress consisting of one of the sans senf type faces, which satisfy the modern mood for purism for extreme simplicity and lack of ornament in type forms as in many other things

Both Bodom type and Goudy type, as the student of typog raphy undoubtedly knows, are modern adaptations by the famous type designer Frederic W Goudy, based on classic roman letters The sans serif types (or letters without serifs) are "thinned down" or refined versions of another old fashioned letter Gothic They are "new" in the sense of conforming to new tastes first of the sans serif letters was Kahel designed in Germany in 1923 and representing a complete break in tradition for German

readers from the old Black Letter Since 1927 there have been several American versions of Kabel, or refined Gothic, the better known of which are Tempo, Vogue, and Metro, cut by different foundries but all essentially the same These faces all show a bold, medium, and light, giving the necessary variety for newspaper beadline and general purposes. There are also some still more deheate Gothic faces, suited to advertising and feature needs but not to news purposes, and there are the beautiful Gothic faces recently designed by Lucian Bernhard, which might serve many special functions in picture layouts

Whatever bead type the newspaper uses, cutline type will be selected to harmonize with the general type dress of the paper Headlines and cutlines will be so placed as to strengthen the picture layout by directing the eye toward it or by framing it or "backing it up" in one fashion or another

#### HEAD TYPE AND PICTURES

News heads are so dummied into the page that they contribute to the general motion of the layout, that they intersect or "point to" the putters, and that their bands of black provide a framework which offsets the halftones static arrangement of heads by dummying heads of the same column width under one another 4.2-column head placed lower on the page than another 2-column head will look better if, instead of intersecting the same 2 columns on the page, it begins at the middle of the one higher up and extends a column beyond it. If heads are used on the page in this "interlocking" fashion they will contribute to diagonal feeling of the picture layout on both front and inside pages. (Figs. 30, 31, 32, 374.)

A group of newsphotos is helped by a head which juts into it or intersects it at some point along its depth, for the line of bead type will serve the graphic function of pointing to the interactive, even though it does so without the reader's being consciously aware of the fact. A boldface headline or long head across the top of a page may "tie up" visually a picture group on the left with one on the right, making the page layout a unit instead of an arrangement of separate spots. Some newspaper front pages are now using alternate hanners in boldface and in lightface type, and such black and medium dark bands can provide an interesting element in the whole layout. The point is that the picture editor.

should cultivate an eye for the ways in which the heads affect the picture presentation

#### BODY TIPE AND PICTURES

Recent years have brought much improvement in designs for body or text type. Most newspapers now use faces with well rounded letters which are even in weight, easily read, and do not "fill in" in printing. Body type visually provides the background for the pattern made by heads and balftones. Yet too much gray type on a page looks dull and uninteresting. Sometimes, too, the body type looks so small and bard to read that the eye is repelled. Over a period of years there was a tendency to decrease the size of type in order to print more news. Now there seems to be a trend in the opposite direction, for the sake of readability.

Whatever size body type is employed, it can be given variety of appearance by using some full-face or itahe paragraphs, and by breaking it with subheads, by indents, initial letters, and asterisks. It should never be allowed to look like a vast gray waste on the page, and when it does even the most attractive picture layout will take on some of the air of surrounding dulhess.

#### CUTLINE TYPE AND PICTURES

Picture layouts make use of two forms of cutlines (1) the overline, in fairly large type face, across the top of the picture group or serving as a heading in two or three shorter lines at the top, (2) the explanatory caption, sometimes referred to as an underline because it is placed under each picture in the layout or under the layout as a whole This explanatory cutline may often be placed at the side of instead of beneath the picture There is one rule which must be firmly observed This is that the relation of cutline to picture be obtious to the eye Nothing is so annoying as to have to search wildly through a picture group in order to determine which caption or cutline is meant for which

Cullines Need Strength Since cutlines form an integral part of the picture layout they must have certain qualities. They should be strong enough, not to provide a separate spotting for the page, but to blend with the rich tones of the newsphoto. Lightface hody type used for explanatory captions (unless strengthened by a run in sidehead in a holder face) has a washed-out

appearance in layouts for newspaper pages. Usually a little larger type than is used for text, in full face, will look best for captions. For overlines a regular head type will be used, not so large as heads on the page.

#### CHOICE OF HARMOSTEING TYPE

Without attempting to give nil possible type selections for modern newsphoto layouts, we might point the way with n few possible choices If the newspaper uses Bodoni boldface heads on the front page and other news pages, 1- or 2-column pictures will take an overline in 18-point Bodoni boldface italic and 3-column layout nn overline in 21 point Captions on news pages will look well in 8-point boldface of the body type or may be raised to 10-point boldfnee. On the feature and woman a pages of such a paper variety may be obtained by using lightface Bodom for regular heads, and putting standing feature heads and column heads in the lightforce of one of the new source-serif types based on the old Cheltenhum. These will negord better with Bodom than would a sans senf letter. Several foundnes are making these square-serif letters under the names Karnak Stymic, and Memphis If these heads are used on the page nlong with Bodom light heads, then the picture layout may use n Bodoni italic lightface overline and underlines in 10-point light face of the square-serif

Similar choices would be made for a newspaper which used Goudy boldface captions in 10 point would look well on news page layouts with overlines in 18 point Goudy boldface itable for 1 or 2 column pictures, 21 point for 3 columns For a paper using a suns serif lead letter the overline will be in the obligate of this (it is improper to speak of the table of a suns serif type) and the captions may be either in sans serif medium boldface, in 10 point, or in the boldface of the body type used

#### SEARCH FOR ORIOINALITY

Sometimes the picture editor feels that he needs a type out of the ordinary, to provide a striking heading for a column or a fashion layout or for a big feature-page layout. He may call on a member of the art department staff to do a little fancy hand lettering. All types were "hand lettered" at some time or other, hoth in their ancient traditional forms and in their modern adaptations, but the work was done by men who were consumate artists in their field. A newspaper may have a typographical genius in its midst, but all too often it has not. So much of the hand lettering we see is vulgar or tawdry in taste. Freaks of the hand letterer's imagination, tearing across the page or surrounded by weird hoxes and horders, mar many a layout of really striking pictures. The remedy is to oblige the letterer—when lettering must be done—to follow one of the fine type faces to be found in any of the modern type-specimen books.

Before resorting to hand lettering the picture editor should make sure that the composing room has no type suited to his special purposes Many faces which are carried because advertisers occasionally call for them will prove useful to him at one time or another Some are as free and flowing as any hand lettering, yet properly proportioned and harmonious as well There are the cursive letters resembling handwriting, there are letters made with a brush stroke that are extremely informal in effect, there are the three dimensional letters that have proved so dynamic in their appeal and that are now used only in advertis If the newspaper does not have them, they can always be copied, for the type books invariably give the complete alphabet They will help give distinction as well as originality to feature layouts employing newsphotos. So as to be aware of the resources at his command, the picture editor would do well to obtain some of the standard type-specimen books and study them carefully He might keep in a drawer of his desk the hooks of the Linotype Company, the Intertype Company, the Ludlow Typograph Company, the American Type Founders, and the Monotype Company Out of these he will get ideas for faces that fit many kinds of layouts and that are superior to hit-or-miss hand-lettered lines

#### PLACING CUT CAPTIONS OR UNDERLINES

The proper type face for cutlines is important, but the placing of the cutlines can also do much to increase the effectiveness of a newsphoto layout. When the layout is uneven across the top, a strong overline, with enough words in it to reach from the left to the right edge of the picture group, will often help to create a unified effect.

Cut captions or underlines should be regarded as a unit in the layout and therefore very carefully written and dummied Some editors lean to captions that are set as blocks of type, carefully squared off, with the last line filled out to the end If the type is small and the block runs deep—as, for instance, an ohlong of type 136 in wide and 3 in in depth-it will be found difficult to read. for all that it contributes to the design Irregularity is apt to increase legibility, by providing a little white space, and this is a point which the layout man should at least consider

A cut caption should not be crowded too close under the cut. with no white space above or below or at either end of the lines of When a caption of two or three lines is placed below a halftone, it will often look better if indented 2 picas at each end and given 2 meas of white space above and below. In general, it is a good idea to have at least 2 picas of white all around any caption and perhaps more if the caption is a large block of type

Sometimes a mortise or oblong is cut out of the face of the halftone cut and the caption is set into this hole. Such a caption in a mortise should be regular in form, and the rule that white space must surround it should be strictly observed. A mortise may likewise be created by cutting into one corner of a square cut or by stepping two cuts off in such a manner as to obtain an oblong space for a caption, which should neatly fill the mortise except for the white frame around the type

An interesting way to set a caption under a portrait is to make each line of type a little more than half the width of the cut and place it flush right under the cut Thus, if we had a 2 column picture of a prominent man or woman, we might order a cutline 15 picas wide, to be set flush with the right hand edge of the cut. in two or three lines, leaving white space on the left, or we might have it set in 10-rica measure and center it under the cut, with white space on either end

It is important that the one ordering such cutlines mark the copy with proper directions for the printer. All type except regular hody type for standard news columns is set in the measure indicated on a slug which is 30 picas long and then is sawed off to the length of the type line A 10-pica caption would be set in 10-pica measure on a 30-pica slug, then sawed to 10 picas If it is to he placed under a 2-column picture, this means that the empty

space beside the caption will have to be filled in with metal slugs in making up the page, and the printer may overlook the directions for placing the lines

Much trouble can be avoided by marking the cutlines "Set 15 picas flush right on 2-col slug" or "Set 10 picas centered on 2-col slug". In sawing the slug the printer will then leave the metal that is needed to fill out the width of the cut and to give the caption the desired position beneath the picture.

Cuts that leave a half-column space on the side for a caption are often very effective Two a 1½ column cut is placed in a 2-column paper, with a 2-column overhine and a half column cutline down the side Such a half-column caption looks best when it does not run too deep, so that there is a good depth of white above and helow it, and it should have ½ em on either add if it is not otherwise indicated, the printer will probably set this caption so that its lines are identical in length. In other words it will he squared off on the sides. If the picture cities wishes he may mark it "Set ragged" in which case the length of the lines will vary and there will he a little more white space around the type. When the cutline is to he set ragged, it is a good idea to compose it with this in mind and indicate to the printer what words to include in each line. Otherwise many words may he divided on the ends of the lines, and the caption will he hard to read. In sending such a caption to the composing room it might, then be marked "Set 6 picas, indented ½ em on each side", or "Set 6 picas ragged".

#### CUT CAPTION WITH RUN-IN SIDEHEAD

Many editors like to begin all captions with two or three words in larger type to attrict the reader's eye. These may be simply the first two or three words of the explanatory cutline as it stands, or they may take the form of a catch phrase or legend which dmws the reader much as a headline over a story draws him to the smaller body type. Such a run in sidehead abould be pithy but not slangy. It should be set in type a size or so larger than the type of the caption, but not so large that it creates little distracting black spots in the layout. With a caption in 8-point Bodoni boldface roman the sidehead could be in 10-point ultra Bodoni talic, or with a 10-point Bodoni boldface roman exption

it might be 12-point ultra Bodom italic; or either of these could be used reversed, caption in italics and sidebead in roman. If cans-senf type is used for the cutline, the run in sidehead will look well in cass of a size larger.

Another manner of setting the sidebead is to put it in roman caps, then finish with a cuttine in talke lower case, or the sidebead in italic caps and the sidebead in roman lower case. To illustrate, the sidebead might be in Caslon boldface roman caps, followed by the rest of the caption in Caslon boldface italic lower case. Life very effectively departs from typographical standards in its use of Gothic run-in sidebeads combined with captions in lightface roman. Only the editor who has developed taste in such matters will be ready to experiment with more unusual combinations successfully.

Each part of the caption should be marked carefully with instructions to the printer on bow it is to be set

#### DOUBLE PRINTING

Occasionally a boldface caption or overline or heading is stripped onto a halftone in what is known as double printing, that is, it appears in black letters directly on the light part of the halftone background White letters on dark tone can also be obtained by the photoengraver Double printing adds to costs and will be reserved for special purposes. Too small a type should not be used, probably not smaller than 10 point for a newspaper.

When double printing is desired, the line or heading must be set and avance of ordering the art. A proof is pulled on glazed paper and is furnished to the engraver along with the photograph or layout. The halftone negative is first printed on the metal, which is then reexposed to light in a contact frame under a negative line film of the lettering in exact position and with sufficient area of black surface to mask all parts of the metal except where the letters are to be printed. White lettering on a dark halftone is obtained by stripping the positive line film of the letters onto the halftone film before printing takes place. Hand lettering may be done directly on the face of a photograph to be copied in halftone, or a line of type may be set and pasted down man anarow strip on the picture. In this case the letters will appear in halftone, on a pure black or white

#### SUGGESTIONS SUMMARIZED

To summarize briefly the suggestions we have made

- 1 Cutline type may show a contrast but should harmonize with headline type used in the paper
- 2 Cuthing should have sufficient weight or tone to harmonize with halftones and are therefore often used in boldface
- 3 The type chosen may in special cases as for some feature layouts, reflect the mood the pictures are meant to convey
- 4 Hand lettering should follow the forms of the excellent faces to be found in the type-specimen books and should avoid eccen tricities which may be in bad taste
- 5 Cut captions may be placed (a) under the cut, (b) flush right, in narrow measure under the cut, or centered with white space on each side, (c) in a mortise cut out of the face of the cut or in a mortise formed by stepping two cuts off, (d) in half-column measure beside the cut, (e) double-printed on the picture an engraving process, hand lettered or pasted down on the picture before it goes to the engraver
- 6 Overlines may be (a) centered over a single cut, (b) run full to create unity when the top of the layout is uneven or open, as with 145-column cut set in 2 columns or a layout with caption mortises at the top, (c) omitted entirely if the cut or layout is directly under a banner line on the page, double-printed, or hand lettered on the face of the layout

#### KEEPING TRACK OF CUTS AND CUTLINES

Much unnecessary grief is occasioned in a newspaper plant by lack of proper system for routing and assembling cuts and cutlines. Some editors order their cuts but fail to order their
cutlines until the lest moment, when they place a burden upon
machines in the composing room which may be in use setting
advertising copy and thus cause considerable difficulty in getting
the paper to press. Department editors sometimes have cuts
delivered to themselves several days before they are to be used
and then fail to deliver them to the composing room along with
the page dummies or even mislay them

The place for cuts is at the cut bank in the composing room, and they should invariably be delivered there from the engraving plant. The cut bank should be equipped with proper storage facilities for keeping advance cuts, so that it will not be necessary to deliver them to editors and so that they may be on hand when needed. It is the duty of the man at the cut hank to hase the cuts, usually on standard metal base, and to place the cutlines which likewise come to the cut bank after they have been set and proofread, with each layout exactly as they will appear in the page. This saves time and labor at the time of making the page up on the stone.

For such a system to work it must start with the person ordering the art. At the same time that the editor fills out an order slip for a cut or layout, he should write the captions (overline and underlines) and send them to the composing room. He should make sure that the slugs on the art and cuthnes correspond. Thus the order for art and the order for cutlines might each he slugged "City Edition—Fire," or "Sunday Woman's—Gown." The editor will at the same time enter the slug "Fire" or "Gown" on the page dummy, in the space he has marked off for the layout Each separate photo sent the engravers also hears these slug words.

Usually the engraving plant delivers the cuts, an engraver's proof of each cut or layout, and the original pictures to the cut hank. The slugs on the originals guide the man at tha cut hank in assembling layouts and cutlines. The Sunday department, if it uses large, complicated, multiple-cut, or pastedown layouts, may find it a hetter plan to have the engravers send the cuts to the cut hank, the originals and the proofs to the Sunday editor. At his desk the slugs are immediately transferred onto the proofs and a layout on a small dummy is attached to the proofs when they are sent to the cut hank. Of course any delay in doing this will hold up the work of the cut bank. If done regularly and promptly it will relieve the composing room of the necessity of handling large numbers of original photos or unwieldy pastedowns. The engraver's proof should be checked to see that the work has been satisfactory and that dimensions are right.

#### A. APPLICATION EXERCISES

1 Select a picture layout from a recent newspaper in which you think the type used for headlines does not harmonize with the emotional tone of the content. Select two layouts in which you think the type used for headlines both harmonizes with the emotional value of the content and with the

type faces for news or feature matter on the page Specifically justify your selections in each case

- 2 From a recent newspaper select a news picture layout in which you think the headline does not point to the picture or contribute to the rhy thm of the layout as well as it might. Paste this layout on a sheet or sheets of copy paper and dummy in another head which you think meets your objections.
- 3 Dummy an 8-col page for a newspaper showing two or more news headlines of the same column width which "interlock." to produce a diagonal feeling. Select a news or feature page from a recent newspaper in which at least two of the five text-explained devices have been used to prevent a gray waste of body type from detrateing from the picture effect.
- 4 Suppose you have a 2-column picture of a map showing the stratege importance to Japan of the capiture of Canton, a 4-column lay out showing lapanese tanks entering Canton, with an inset map showing the 500-mile angle from Canton to Hangkow Dummy these two picture groups on opposite sides of an S-column page Write headlines for both groups, indicating the typo face and size for each Assume that your paper uses Bodom boldface for news heads
- 5 On your dummy for the page in Exercise 4, the your two picture groups together in a way which seems appropriate and effective to you. Write underlines for these two picture groups, indicating the type you would use, where you would place the underlines and how wide you would make them, assuming that the body type of the page is normally 7 point.
- 6 Select from a recent newspaper a halftone picture which has five or more lines of caption below it, but which you think lends itself to a mortised caption. Indicate the mortise and rewrite a briefer text to go therein showing how much white space should be left. For this same picture write, and show the placement of, an underline to be set flush with the right-hand edge. In each case show precisely what instructions to the printer should go with each underline.
- 7 For the picture selected for Exercise 6, write a 4 to 5 word overhied Mark the type to be used in this overline
- 8 Select from a recent newspaper two examples of sans-serif type and one or more examples of what you believe is hand lettering

#### B CHAPTER-ORGANIZING QUESTIONS

- 1 What qualifications should combine, at least moderately, in a news picture editor?
- 2 What desirable effect may be obtained by the tie-up called for in Exercise 5?
- 3 What bearing has the darkness or lightness of a halftone on the typography of the explanatory caption?
- 4 Suppose you have a 4-column halftone which requires considerable explanation. What objection is there to printing this in the usual body type of your news page in straight lines flush with the sides of the cut? What would you do to remove this objection?

- 5 What three type faces are commonly used styles of square-serif letters? If one of these type faces is used as a news head on the feature or woman's pages, what type would harmouze well for a picture layout head and underline?
- 6 If same-senf head type is used for news stones on a page, what type face could be appropriately used for picture overlines and underlines on the same page?
- 7 What is the aim and what the danger in hand lettering for picture or feature heads in a newspaper? What precaution may be taken to avoid this danger?
- 8 What is meant by "Set 6 pieas ragged?" By "Set 6 pieas, indented ½ em on each side"?
- 9 Explain what a run-in sidehead is and what effect is aimed at in its use In selecting type for a run-in sidehead, what unpleasant effect should be guarded against? If the hody of the caption is in 8-point Bodoni hold face roman, in what size and face may the run-in sidehead be effectively set?
- 10 Explain how double printing on a halftone is done What practical disadvantage is there to double printing?
- 11. What limit should there be to the securing of contrast in the use of culling type with respect to headline type on the same page?
- 12 Last five places where picture captions may be placed. List three places where everlines may be placed. Point out what relationship between caption and illustration must exist in any case?
- 13 Should engravings be sent from the engraving department to the department editor involved? Explain your answer

#### CHAPTER XVI

## FRONT-PAGE PROBLEMS, MAKING THE FRONT PAGE SERVE THE ADVERTISER

#### PREVIEW QUERIES

Arthur Brisbane prophesied future front pages would present all important vot news highly condensed, while inside pages devoted themselves largely to interpretation and continuations. A sharply different modern view regards a front page as the newspaper's "book jacket to sell the issue and induce the reader to turn to inside pages. Which do you think is the sounder view?

Will the poster effect, which news photography can give a front page, influence strongly both the makeup and the advertising value of the newspaper?

Does it lead readers inside the newspaper to start many stories on Page One and continue them on inside pages?

Is the principle of the "tempo dynamic" structural layout, inaugurated in 1937 by the Glendale (Calif) News Press, an indication that makeup is improving in what has been called "the changing newspaper'?

How influential a part has radio advertising played in this new trend toward "photography-conscious" book-jacket plan for presenting news and comment?

Does a centered large nameplate with boxed ears at each end help or detract from the aliveness of a front page?

What strong objection is there to departmentalizing news in the daily newspaper in the way which has made Time and News Week so popular and successful?

NEWSPAPER front-page layout was considered in a general way in an earlier chapter. With better knowledge of picture layout we are prepared to return to the front page, to examine some of its specific problems. Experimentation with Page One is going ahead steadily in many parts of the country, both on large-format papers and on the tabloids. Some of the achievement has been outstanding. Designs for front pages have varied, but there is the beginning of recognition that a new graphic element, the newsphoto, can give the page poster value it never had before.

So much has heea said about modernizing typography, it has seemed that not everyone recognized the role that newsphotos had played. As a matter of fact, the pictorial coverage of the news is rapidly forcing the issue of a modern "structure" for Page Oae. New materials demand new designs and methods in any field. In the early days of the skyscraper architects still tried to fit Grecian pillars into the façades of steel frame giants with elevator arteries. After a while the elevator and the steel skeleton demanded recognition through appropriate design Something similar is happening to the newspaper. Experts explain that its design must be functional. It must reflect its purpose and the elements of which it is composed.

Modern type faces have played their part, providing more beautiful and suitable dress in which to display the news. The Bodom boldface headlines in upper and lower case, first adopted by the New York Tribune (now the Herald-Tribune) on December 3, 1918, have since heen copied by papers throughout the country. Goudy's distinctive Bodom type undoubtedly helped this aewspaper to what he Ayer Typographical Contest three times. Yet in 1937 the prize went to the Los Angeles Times, for a page which combined modern type, a modern form of headline, and newsphotos, in a front page presentation that was new and starting.

The Glendale News-Press (Glendale, Calif), which wou the second award in 1937, had likewise made dramatic use of these same materials. Like the Los Angeles Times, it employed a sans senf headletter, balancing type masses against picture masses in a structural layout which it named "tempo-dynamic" Going still furthur in the hold use of modera facilities, it splashed its nameplate in blue and dropped its column rules

These 1937 Ayer awards were the signal that it was time to give inphoop shirts. Many changes in newspaper dress bave been tried siace thea. They are in the direction of a page that is built for dramatic news display, out of the elements of head type halftone, and hody type. Considered graphically, each of these brings a different tone value to the page, and these tones, halanced against each other, just as they might be in a poster or advertisement, are what give the page its power of arresting the eye

On May 1, 1937, The Toledo News Bee, a Scripps Howard paper, mangurated a new page design by Gilbert P Farrar Its

revolutionary pattern used a black rule to mark off a rectangle or hull's-eye portion of the page for big news, including a newsphoto The part outside this rectangle was reserved for features and feature pictures and for listing under a display head the contents of the inside pages The type used was also of a new sans-serif design, Metro medium, in flush-to-the-left headlines general effect was that of a news page laid on a feature page, a novel graphic presentation, further enhanced by the daily use of color on Page One

In the same month (May 24, 1937), the New York Evening Journal appeared with a front page which could be folded in quarters, for easy reading, and still maintain its graphic display The nameplate occupied a rectangle boldly ruled off in the upper left hand corner, with a headline below it, across the first four columns of the page. The upper right-hand corner was occupied by a newsphoto in large dimensions, topped by a 4-column boldface overline or headline

These pioneer front pages have been followed by many other attempts at modernization Some have sought to make changes in typography alone, with the new type faces and the flush-left or streamline heads A few have realized that dramatic appeal is better obtained by using both pictures and type to create a layout with motion Old-fashioned notions that pictures do not helong in outside columns have been east overboard. So far it has been impossible to bleed pictures on newspaper presses, but this mechanical obstacle will probably soon be solved. Meanwhile methods of the graphic arts are improving the poster values of Page One

Yet the whole problem of the front page has only been thought through by a very few The function of Page One is twofold to

sell the paper, and to get the whole paper read

If we were ealled upon to plan a jacket for a book or a cover for a magazine, we would probably realize that these two purposes were involved. The book wrapper attracts the reader by its color and pattern, then seeks with a "blurb" to interest him in what is between its eovers This second factor is all important · People must be induced to read and tell their friends, or the sale of the book will be short-lived

In the case of the magazine cover, poster value is important for newsstand sales the cover must sell the magazine Yet large numbers of subscribers are not greatly affected by this factor since they receive the issue regularly in their homes of the must do more than get attention, it must make them interested in sitting down and reading the magizine. Often it does this by announcing some of the best offerings to be found inside a famous author, a full length novel an inticle of vital interest. Only if the subscriber reads every page of the magizine will be have been exposed to the advertising that the inside pages contain, so the purpose of the cover is not only to nitract but to induce him to open up

The newspaper's front page has a function closely resembling that of the magazine cover, at least up to a certain point | It will be displayed on newsstands and it will be delivered to homes must sell the paper It must also—and this is what so frequently is overlooked—get the whole paper read If the purchaser glances over the front page banner lines and big stones, then throws the thing away, the advertisers will not be getting results and the financial security of the paper will be undermined I ditors often think they can accomplish this purpose of getting the inside pages read, by starting all big stones on the front page and then jumping them to inside positions. Careful surveys of reader reaction made by Dr Gallup show that only a very small per centage of readers ever bother to turn to the pages indicated in the jump lines. Most are content with the gist of the story as gnthered from the lead We have managed to develop a nation of "front page readers" Dr Gallup points out, and as n result the advertisers are giving their money to the radio. As the first step then, in making the front page fulfill its proper function it is obvious that we must build a page which gives the reader less but promises him more, a promise which only the inside pages can fulfill (Fig. 25)

Before pursuing this thought further, let us consider mother angle of the problem. News coverage is very complete today and readers have been tauight to take a virtl interest in the latest happenings on many fronts. Foreign wars, national politics local crimes, scientific discoveres romance, adventure, and disaster around the globe, all compete for a ranking position in the report of a single day's happenings. Add to these a multiplicity of special columns and features editional comment, sports news and society, and you have a bewildering assortment of items.

Fig. 27.—Partly departmentalized is the Richmond Times-Dispatch. It plays "the story of the day" and a few others on Page One, but saves much important news for maide pages where news is grouped and classified.

for foreign affairs, for local features, etc., he will turn from the front page more readily

A table of contents on the front page is better than no key to the paper at all. However, it does not actively entice the reader into the paper. For this, definite "batt" is needed in the form of well displayed bulletins, headhnes, and blurbs describing the content of the inside pages. A complete table of contents is important to a large sized paper with much scattered news and feature material. It is not a particularly attractive unit on Page One, which should be firmly regarded as the "cover" page of the paper. The table should be given a permanent position where it is readily found, possibly in the form of a box on the page facing the editorial page, or on the front page of the second section (commonly referred to as the "split page"), when there is one. A boxed or boldface reference to this index, on Page One, will in itself serve as an inducement to the reader to open up the paper.

Pictures can lead the reader into the paper as surely as stories ean—perhaps more surely, because of the emotional appeal of good news photographs. When a single dramatic shot of a big news story is played boldly on the front page, and the reader is referred to the daily picture page or to an inside page for more, he is practically certain to turn to them. Picture appetite can be depended upon as a means of getting the paper read, much more than appetite for reading matter. The same man or woman who never reads the jumps probably always looks at the pictures.

When there is a single news story breaking of such proportions as to make its pictures overshadow all others for the day, the front page might feature only the most dramatic newsphoto of this story, playing it large and making the reader turn inside for other pictures. When there is no such overwhelmingly important news story to be had, a sound psychological treatment of a large-format Page One is the use of a broad or narrow strip of pictures down one side, each picture relating to a different story, with a cutline referring the reader to the inside page where the complete story and additional newsphotos may be found. Such a strip may be balanced by the weight of a larger picture elsewhere on the page, or by proper grouping of headlines and type matter, to give the page as a whole diagonal feeling, or the picture strip may take the center of the page, with small cuts on the sides of

the page so placed as to create diagonal motion and contrast of size

When there are several big news stories breaking and all have furnished a supply of dramatic news shots, it may be worth while to turn the entire front page into a picture page, dividing it into horizontal bands of alternate banner lines and newsphotos. The cutlines under each strip of pictures will tell enough, in conjunction with the banner line, to whet the reader's appetite and make him turn to the page where it is indicated he may find the complete word and picture coverage. The biggest story of the day will naturally take the top banner line and broad picture band above the fold (Fig. 23)

Of course there are editors who will not agree to give this space to pictures on the front page. For the more conservative, it is always possible to plan an asymmetric arrangement of the front page, using one or two newsphotos in 3 columns, or a deep 2-column picture balanced by some smaller cuts on the page. These may be the faces of interesting personalities in the news, in 1-column or even ½-column size. As often as possible they should refer the reader into the paper for the complete story, instead of serving as illustration to stories that appear on Page One.

The poorest attempt at fulfilling the second aim is to start stories on Page One and jump them to inside pages, since few ever read the jumps and these (as we shall see later) serve to make the appearance of inside pages dull

To sum up, the front page is not just a big news page It is the cover page of the paper, and, like the cover or jacket of a book or magazine, it must accomplish the twofold purpose of selling the paper and gelting the whole paper read

Good ways to use the large-format front page as a cover page which sells the paper yet leads the reader inside, are

I Dramatic play of the one big story of the day, by means of one large newsphoto and banner line, with the story complete in a good sized readable type, possibly in wide measure in a box of no boldface type the reader is referred to an inside page, where more pictures, side-light stories, features, and "sob" stories connected with this one big news story rasy be found. On this type of front page, other big news stories of the day are treated in headlines and bulletins, complete in themselves as news flashes,

but brief and serving as blurbs for the full accounts in word and picture form which may be found inside the paper | Each head or bulletin carries the page-reference line in boldface type Fea ture stories of popular appeal, important editorials, comics, or any other material which the paper contains are likewise blurbed on Page One

2 Samples of the best newsphoto coverage for the day are displayed on Page One A 2 or 3 column strip of action pictures may be used, each on a different story and each carrying a well displayed reference line to the page where more pictures and the complete story may be found. Such a stop of sample pictures may be balanced by a separate dramatic shot of the big story of the day or by a large box of type matter or bulletins, by small cuts or by a typographical treatment of the page which gives diagonal balance to the layout A daily news picture strip may become a permanent treatment of the front page if desired and will only be discarded when an overwhelmingly big news story with newsphotos forces it off

3 Instead of the wide strip of sample newsphotos, a narrower strip (I column, 11/2 column, or 2 columns as desired), showing candid shots of the faces of people in the news, can be made a semipermanent attraction on Page One (Fig 25) The personality strip should be used to lead the reader to the inside pages of the paper, in the manner described above. In other words, each picture should be a "teaser," for if it is complete in its message no purpose is served

4 A good front page could be built to carry both an action picture strip and a personality picture strip. To get motion into such a page layout it would be best not to have both extend the full length of the page They should be so arranged as to create

diagonal feeling

5 Instead of the vertical strips of action or personality photos the front page is divided into horizontal bands, starting at the top of the page below the nameplate with a banner line on the most important story of the day Below this banner is a band of pictures covering that story Then comes another banner line across the whole width of the page and below it another picture band on its story Then a third banner line carrying a third band of newsphotos Finally, at the bottom of the page there is a banner line standing alone. In planning such a page the picture editor must remember the principle of rhythm in layout discussed in an earlier chapter. If every hand is the same width, the page will be static and dull. He gives the page motion by increasing the width of the hands in regular order, probably from a narrower band at the bottom to a wider one at the top, because this will give him the best play for his most important story above the fold. In other words, his layout has the rhythm of a wave from its lowest point to its crest. Heads may be stepped up in size from the bottom to the top of the page, or they may all be kept one size, serving as a recurrent unit in the wave rhythm If varied at all, it must be successively and in harmony with the picture hands.

- 6 The newspaper's nameplate, instead of occupying the whole width of the top of the pige, is brought over flush with the left hand margin, leaving a space of 2 or 3 columns on the right. A newsphoto, of the action type or a candid personality shot, is pushed up into this space heade the nameplate, which has the effect of giving it a spotlight position on the page and at the same time creating a page layout with strong diagonal feeling. As an alternative, this space may he used for news bulletins in boldface type, creating a type block of oblong shape which will spot the layout just as a photograph would. Such a type block can then halance a picture strip on the left of the page, and both will serve to lead the reader into the paper.
- 7 A dramatic news shot may extend to the top of the page and be mortised with an oblong hole into which the nameplate can be fitted when the page is made up in the composing room. Or the nameplate can be proved up on glazed paper, copied by the engraver, and stripped onto the picture when the cut is made.

These suggestions for picture treatments on Page One cannot possibly he comprehensive and final, because new pictures and new picture editors will he sure to hring forth new and dynamic front page layouts. In general, it will be noted that we have not suggested any departure from regular oblong cuts on Page One, hecause unusual shapes are not suited to rapid reporting of the news. Secondly, it will he noted that we have placed pictures in the outside columns and that we have allowed them to run well helow the fold prohably only encourages the reader in his lethargy about opening the paper up. Nevertheless, much of the picture interest must

be held above the fold, in order to sell the paper, and the editor will be wise to note just where the fold does divide his picture strip or layout

In the vertical strp, while it is possible to keep all pictures uniform because the strp occupies a place as a unit in the general balance of the page, still it is better if possible to observe the principle of rhythm, increasing the depth of the cuts from bottom to top of the strip. The student will see at once that this conforms better in several ways with the principles of picture layout we have already discussed.

Incidentally, there is no room for confusion between the strip of sample news shots for Page One and the so called "movie strip" The movie strip initiates the motion-picture-camera method by showing a single action at various stages—such a strip might, say, show a horse and rider leaping over a hurdle and would give either stages of this single leap. Such a feature strip is sometimes very interesting. Its pictures are most effective when kept the same size, because that is what we expect of a motion picture. In contrast, the front page strip of news pictures is made up of widely different shots of several different news events. It does not imitate the motion picture and should not copy its technique

Type, on such front pages as we have described, must be used in such a way as to work with the pictures in creating balance with motion Stong lines of head type can form a connective link visually between a strip of news pictures on the left and a single news shot on the right of the page thus tying together the units in the page layout and accentuating diagonal feeling

A strong movement from the lower left to the upper right corner of the page may be further halanced by a 2-column head in the lower right corner of the page. Once the editor gets to thinking of this matter of motion in layout, he will readily find ways of arranging the elements of the page, pictures, bead type, boxes, and body type to enhance it. He will develop, as indeed he must, the ability to shuffle all the stories and pictures on the page in a make-over in the composing room and still not lose this one valuable factor of motion.

Newspapers quite universally adhere to the practice of decreasing the size of head type below the fold, yet the bottom of the page must be kept interesting and not too gray. This may be

accomplished by using shorter stones, bulletins, and blurbs, by breaking up long stretches of text with subbeads, or by setting all quotations in boldface, depending of course on the general style of the paper

In modern page layout it is often thought desirable to eliminate
the column rule. Undoubtedly this helps to give the layout freedom
and motion, but in dropping column rules, be sure to increase the
white space or "gutter" between the columns to not less than
1½ picas for 12-pica columns. Otherwise the page will not be
legible

#### MODERNIZING THE NAMEPLATE

Before leaving the subject of large-format front pages, a word might be said about newspaper nameplates. Some papers are modernizing the nameplate along with the whole general presentation of Page One. Others cling to their traditional nameplate as a country doctor might cling to a weather beaten shingle, believing his practice would vanish if the shingle were modernized. Many of these nameplates are in old fashioned black letters, heavy and antique in feeling and centered at the top of the page with boxed "ears" on either side and the date line set between rules below. They spot the page in a fashion which at once suggests tertical or symmetric balance, and, for this reason and because they are of a size which dominates, they definitely interfere with the job of creating a page layout which has asymmetric feeling, or balance with motion.

There are several cures for this ailment

- 1 The nameplate may he kept strong but moved to the left of the page, so as to aid rather than hamper the asymmetric layout. The balanced ears of course must go, and it may be desirable to decrease the size of the nameplate, if it crowds the top too much in this position.
- 2 The nameplate may be redesigned in a modern sans serif or square-serif letter, kept large but fairly light so as not to detract from the visual function which the bold banner heads perform. The headlines not only announce the news but serve as dark horizontal lines which tie up the separate elements of the page. The nameplate should not interfere with this. The modernized nameplate will also work better if moved to the side of the page.

3 If the center nameplate is retained in its traditional type, it should be definitely decreased in size or lightened in effect so that it does not dominate the page. The ears will be better without the boxes, which accentuate the vertical balance.

Newspaper chenteles do exist which regard sudden or drastic changes in newspaper dress as offensive Many travelling Kansas Citians long accustomed to the gray tone and conservative headlines of the Kansas City Star, find the "street sale" display of Chicago and New York newspapers "overdressed" Custom is a powerful criterion, and readers accustomed to conservative makeup may lose confidence in a paper which suddenly begins to wear what they may construe as a cheekered suit and red vest. Yet these same readers increasingly enjoy mass appeal moving pictures, tune in on highly condimented radio programs, drive on pleasure jaunts with increasing frequency in streamlined motorears, broadcasts blaring under the dashboard They watch, listen, and ride, whereas 20 years ago the rustle of a newspaper heing read through constituted a note of that news pictures answer a need of quickened tempo, a need of competing interests, journalism needs livelier, more compelling newspaper appearance to compete with lively, compelling claims for the public's energy and time

This change, in some environments, should be strategically paced. In conservative localities the newspaper dust bowl should be irrigated, but not with a roar that suggests in those localities a broken dike. A paper's gray husiness suit may be changed for an Enghish tweed with a subtle dash of red in the weave. Ultimately, what might have lost reader confidence and been charged as "tawdry" may be welcomed as virile charm. A newspaper to succeed must induce readers to regard it as essential to their budget and dully routine. A publisher must change his offering as his clientele definitely changes its appetite, but he must know his elientele. He must not offend them today with what he knows they can be educated to prefer in a year. A middle-ground front-pape makeup, a compromise between the somewhat advanced "tempo-dynamic" arrangement and the gray, all hignews-on-Page-One presentation, can still use three modern principles without incurring the charge of sens-tionnlism. These three principles would be (1) More pictures, some of which refer

to stones on inside pages, (2) a cover jacket policy which gives more complete coverage of the one or two biggest stones of the day on Page One, reserves other big news for inside pages, and carnes an adequate interest arousal of inside page content, (3) sans-senf or other modern design flush left headlines

Even conservative newspapers bave adopted two-deck top heads in upper and lower case type Test after test has proved that few persons read more than two decks of a headline, and that upper and lower case heads are more legible because an adult reads word at a time, not letter at-a time

More Pictures As previously pointed out in this book, pictures with news, personality, and action value, when given enough room to hreathe, seize the attention by instantaneous vividness and tell their story more compellingly than the same space devoted to type. A strip of pictures down the left hand side of the front page has distinct value, partly because it pulls the eye to the left, from which reading hahit leads one naturally to move toward the rest of the page, whereas a picture mass to the right or middle of the page produces hahit made resistance to moving the eye hack to the left.

A solid flow of pictures down the full length of the first 2 columns may suggest to some clienteles an overplay Moreover, the first 2 columns above the fold carry interest in themselves without pictures Dr George Gallup's early surveys revealed that space helow the fold is exceedingly low in reader interest A possible place for conservative papers to use a strip of news photographs with underlines referring to inside pages is across the bottom. The ultra conservative Kansas City Star occasionally uses this plan, but so far without referring to inside stories. The greatest disadvantage of such a treatment is that it gives the page a static appearance, but this may not displease the publisher who wishes to "play safe". It seems well to have at least one picture, as a fixed policy, below the fold of the front page, referring to a story, feature, or editional on the inside of the paper.

If a publisher believes his readers would resent pictures daily across the 8 columns at the bottom of Page One or finds enough pictures of adequate news value impracticable to obtain, he may still effectively enliven this below the fold portion by two devices (a) A 2 column, shallow head not more than four inches

above the bottom of the page, on each side of the lower balf These heads over short stones should preferably be placed across columns two and three and six and seven This is a common practice on the conservative New York Times, but many other papers retain and, unrelieved lower half front pages long stories logically extend down this area and might necessitate umps if this 2 column head policy were obdurate for short stories, the heads can be used to break up the longer stories this case they become in reality 2-eolumn subheads, as is often the practice on conservative newspapers for breaking up 6 or 7 column news or feature articles for which no pictures are available (b) A 2 column boxed or indented description of inside page interests, placed below the fold. If the 2-column heads are used this blurb feature can be placed in columns four and five, extending 11/2 in above the headlines and dropping to the bottom of the page Many variations of this principle will of course suggest themselves to makeup editors and publishers

A Cover Jacket Policy The Richmond News-Leader has used its full left hand column on the front page to index all important stories, features, and editorials in each issue, leading off with Page One stones Many other papers print brief "thumbdex" or index references to inside pages Other papers have used their nameplate ears to call attention to special inside features As previously suggested, this is better than no index at all, but a mere table of contents is not so effective, progressive publishers believe, as brief paragraphs devoted to each story indexed, paragraphs which definitely try to raise questions in a reader's mind and to indicate that interesting answers or data may be found on a specific inside page. The psychological soundness of this is attested by Dr John Dewey's analysis of a thought process, which indicates that the first three steps in any thought are a felt difficulty, isolation of a specific problem, and a suggested solution The practical value of it has been proved by magazine publishers in their cover blurbs and by book publishers in the colorful jacket appeals It is doubtful whether the Richmond News-Leader is efficiently using its front page column one by devoting part of it to Page One stories The space might better be used for fuller interest arousals for inside stories, letting front-page display speak for itself The main object is to get the inside of the paper read

Of course, a hasic rule of advertising must not he violated Do not devote front page space to advertising inside pages which contain little or nothing of interest. The cover jacket policy of a newspaper demands that only one or two big stories he played on Page One and that other important news be netractively displayed on the inside. It pays to advertise, only if you can deliver the goods. Years ago, Hugh Graham, founder of the Montreal Star, gave preeminent display to the one big story of the day, every day. Human attention cannot easily focus on more than one thing at a time, and the field of the attention is definitely limited. The policy of displaying one or two big stories on the front page does not mean the mere limiting of the front page to a single column of one story with the rest of the page devoted to insidenage allusions.

As a matter of fact, a newspaper rarely has more than one hig story a day Some days there seem to be no big stories It sometimes takes creative editorial force and imagination to breathe life into a story in order to build it into what it is really worth For instance, the Kansas City Star gave major display on November 18, 1938, to Germany's temporary recall of Ambassador Dieckhoff Two-thirds of a column was devoted to this No picture of Dieckhoff was printed, no account of the diplomatic or historical background of the action, there was merely the spot news account This conformed with a common news policy simple, terse statement of fact. On the front page of that issue were four other top-head stones and a 4-column news picture The 37 other pages of this issue contained several stories of major interest No front-page description, however, intimated what might be on the inside. At least three of the other four top-head stories on this front page might have been blurbed on Page One and used further to brighten the inside The Dieckhoff story might effectively and informatively have been built up by providing historical, legal, and diplomatic background, as well as a review of American public opinion on the Nazı reprisals for Grynszpan's assassination of Vom Rath, upon which Dieckhoff was presumably being called to report Since there was also an important local story in this same issue, the conservative Kansas City Star might have built up on Page One background and parallel interests on both stories, routing the other three top heads to the inside, but carrying some small

stories, more pictures, and an adequate cover jacket feature across 2 columns at least 8 in deep on the contents of inside pages

Jumping stories from one page to another bas two bad results readers discontinue the story at the "continued" line, reading other stones before they go to the trouble of turning large news pages, and, since many readers read no continuations at all and most of those who do have read other stories before picking up the carry-over, the jump on an inside page becomes either dead or moribund material If, however, publishers find cogeat reasons for jumping stories, two methods may lessen the ill effects of the nump First, they may continue to an inside page only a complete division of a story, for instance a play-by play account of a game, or specific details of court testimony or of a crime which constitute a sequel to the original story, as it were The end of the first part may carry an italies or boldface or indented paragraph indicating that "direct testimony may be found in column 6 on page 8" This Page Eight story then will carry a full sized head and its own individual lead. Another method is to group all Page One jumps on 3 or 4 columns made up attractively in the same corner each day of the same inside page under a boxed 3- or 4-column 24 point head, "Continued from Front Page" Under this, each jump should carry the continued line and a 2- or 3-line, 14-point or 18-point head which repeats a distinguishing phrase from the original head but which varies sufficiently to headline the jumped material and give interest to it

It might be wise for a conservative newspaper to adopt only one of these middle-ground principles at a time, and of course entivening policies other than these three could be developed later. The point is that many papers have found it damaging to change policy or appearance too quiekly. The shift might suggest instability and meretricious tendency. It is not likely that readers accustomed to ultraconservative makeup—and this country contains areas where teste changes slowly—would at all quickly necept a decreased nameplate at the left, with a large picture rising above the nameplate at the right and bunds of pictures or streamers on the front page, particularly when readers an such areas have actively resented even one streamer head a tet the page arrangements earlier described in this chapter show

marked tendencies in present day reader appetites and are admirably suited to certain localities and certain conditions of competition

#### THE TABLOID FRONT PAGE

So far we have considered only the front page of the largeformat newspapers. The tabloid front page offers a somewhat different set of problems. Right here it is important to call the student's attention to the fact that we are not including in this discussion the front pages of tabloid Sunday supplements in large-format newspapers, for these require layout treatment adapted to their own needs and bear no relation to the front page of the daily tabloid newspaper.

The editor of the large-format paper needs to be told that the front page is a cover — The tabloid editor has known it all along He cannot hope to pack all the news onto Page One — The most he can expect is to give the higgest story of the day the display it ments, then tempt the reader to the inside pages — Often he may have groaned over this very limitation, yet it is probably the factor which gets the best results for advertising

Tahloid newspapers can he safely divided into two schools (1) Those which run only heads and pictures with captions on the front page, (2) those which play at least one hig news story on Page One

The Tabloid Pictorial Front Page Display on the tabloid front page faces two difficulties One is that the use of large head type necessary to sell the paper on the newsstands, permits only a very short count of letters and spaces, so that it is something of a feat to state the news intelligibly. It is for this reason that the tabloids resort to so many nicknames and labels for people in the news. Good taste should draw the line against some of the short cuts in verbiage. Yet often it can be said that a slight loss in dignity is compensated by the liveliness of presentation, provided of course that this does not descend to vulgarity.

The second difficulty springs from the fact that a very large proportion of the best newsphotos are horizontals rather than uprights A cameraman photographing a street scene, a mob in action, or a group of people in almost any important news event finds he can include more and therefore tell the story better if he takes a horizontal shot. If the horizontal picture is blown up to the full width of the tabloid page, it leaves, when nameplate and headlines have been taken care of, another horizontal hand on the page. To fit another horizontal picture below it seemed to many editors to give an awkward annearance to the front page.

The layout most frequently resorted to morder to avoid this stumbling block has been one in which three news shots were grouped, one a long narrow picture of a person walking or running, then a horizontal shot reduced to fit the width of the page beside this, leaving a space below the horizontal into which cuttines and a small picture could be fitted (Fig. 28). The trouble with this arrangement is that it so often necessitates use of a long narrow picture for layout purposes only, not because the picture itself is interesting or important. Also, if the horizontal was the really important picture this layout fails to dramatize it. Long thin ladies and gentlemen stepping out of tabloid front pages get monotonous after a while, and even the public may hegm to wonder why they are there

Fortunately, the tahloids have been experimenting, too, with modern layout ideas and many new and dramatic ones have emerged. When the news story was a really tremendous one, as in the case of the Hindenburg disaster, they boldly spread the horizontal news picture across the back and front pages. It is interesting to note, in examining these illustrations, that there was no choice but to play the horizontal newsphoto of the hurming Zeppelin in this fashion, or to reduce it to a size entirely unworthy of its news value. It is noteworthy that the New York Daily News and the New York Mirror hoth adopted the same—and seemingly inevitable—solution.

Trequently the news value of a picture is not so great that it ments the sweep of the back and front pages, or the picture itself is not suited to such treatment. What then? One modern answer is frankly to accept the necessity imposed by the pictures themselves and divide the pictorial part of the front page into two horizontal bands. These can be made effective by a difference in depth, the top band wider than the lower band, and still greater originality and interest have been obtained by double-printing a banner line on each. By double printing a ceman that the banner line is set, a proof on coated paper stock pulled, and this in turn photographed by the engraver and printed onto the metal with the picture in process of making the halftone. As

16° Below! | But Oh, Boy, 25 Forecast! Schools Close

BONUS

Fig. 28—Table d front page layout must cope with the short count of heads and the fact that the average news shot is a horizontal which if scaled to the full width of the page leaves a narrow str p below. The most usual solut on is shown here.

we have already seen, a page divided into horizontal bands can bave rhythm or wave motion, and, even if aestbetics had to be sacrificed, there is no doubt that this would be the sensible way to play two powerfully dramatic news pictures, both horizontals on a tabloid front page

In his search for variety in front-page layout the tabloid editor should not overlook action in the buman face as having vital appeal. There are now available wide selections of candid appeals of personalities in the news. A personality strip of three heads might take the place of the person walking so often used for makeup purposes. Cuthines under each face, referring to the page where the story may be found give the reader that many more reasons for looking at different uside pages. If a good action shot is blown up to occupy the larger space beside this personality strip the possibilities of the front page will have been exploited to excellent advantage.

Complete cutouts of faces that are in the news have been used in combination with large headlines to give an effective tabloid front-page layout (see Fig 22). Headlines and pictures workwell together in such a scheme, both to sell the paper and toget it read, particularly if each story represented on the cover is played on a different inside page. The editor should never forget that his job is to get the reader to turn to as many page as possible. Even in the tabloid, if all interest is concentrated on Pages Two and Three, there is less chance of the advertisers getting the full return on their investment.

Very often the picture combination seen on the tabloid front page has consisted of a tbm upright, a horizontal, and a picture cropped in a circle to fill out the space below the horizontal There is nothing to recommend such an arrangement. It combines shapes which do not harmonize, into an ensemble which

Dines shapes which do not harmonize, into an ensemble which lacks a feeling of motion or rhythm, and is probably therefore the poorest form of display that can be used. Though the layout man may think he has achieved variety, as a matter of fact the

effect is one which fails of surprise value or "shock"

Surprise is a vital factor of layout. A daring action photograph offers enough surprise in itself, and the problem is therefore to play it large enough to enable it to make its full effect felt. Often the cropping has much to do with this. By paring off background that is not needed to tell the story, the action part

of the picture can be blown up to the maximum size. In the case of candid shots of faces, surprise may often be achieved by cropping off the top or back of the head, by tilting the head, or by any device which takes the display out of the usual pattern.

While circles have been misused, the possibilities of the segment of a circle have been overlooked by the tabloid. A quarter section of a circle will combine more harmoniously with an oblong or oblongs and has the added attraction of "incompleteness" which we discussed under picture layout. Of course not all news pictures lend themselves to such cropping, but it is one to keep in mind when the right pictures come along.

Photomontage, though not recommended for front-page use in newspapers of large format, can sometimes be employed effectively on the tabloid front page, combining several shots of a single news story for a smashing dramatic effect which might not be obtained from one shot alone. If used only occasionally it can lend variety to front-page appearance. It takes a little more time for photomontage in the art department, but the tabloids, as they have always used a great many pictures, are usually better equipped to handle the job quickly. In thinking of photomontage for the tabloid front page it must not be forgotten that this is a form of instantaneous or single impression layout, as we have explained above, and is in no way suited to a layout of pictures on several different stories nor even to a layout on one story, where a single newsphoto will give the news dramatically Such a photomontage might fill the entire picture space on Page Onc. or it might be used in combination with a long parrow shot. The segments of the photomontage must remain large enough, with the seenes or faces they display sufficiently large, to have the necessary poster value for the newsstands.

To sum up what we have said concerning the pictorial tabloid front page: (1) its purpose is to sell the paper and to get the paper read; (2) it does not lend itself to any but the simplest asymmetric layout forms; (3) the picture space may be used for a single dramatic news shot; or (4) a news picture with tremendous dramatic and emotional values may be spread over front and back pages; (5) the picture space may be divided into two perpendicular panels of unequal width and the narrower of these panels may be a single news photo or may be a strip of candid shots of people in the news; (6) a photomontage may fill the whole picture

space or be used for the wider of two perpendicular panels (but should never of course be combined with a strip of candid shots), (7) the picture space may be divided into two horizontal bands of unequal width, with or without double printing of headlines, (8) a picture cropped as a quarter circle may be combined with an inpright and a horizontal to fill the picture space or may be large enough to fill the space alone in combination with cuthincs and display type, (9) large head type and candid shots may be effectively combined to give hold display to several stones

Tabloid Front Page Using Stories and Pictures A few tabloids, like the Washington (D C) News, display both pictures and stories on the front page Some interesting comparisons can be made between this Scripps-Howard tabloid and the Daily News in New York, which uses only pictures and headlines on Page One The Washington paper uses a slightly larger format, a 12½ pica column instead of the 12-pica column used by the New York Daily News, wider margins, and a printed page on which the columns run about 1½ in longer The difference in format, however, is not sufficiently great to affect comparisons.

The Washington News plays the "one big story of the day' in bold headlines on Page One, as often as possible with its text complete, thus carrying out suggestions we have made for using the big story to sell the paper A second story, of a popular human interest variety, may get a large picture display on the front page and frequently begin with a few paragraphs under the picture, then jump to the inside of the paper, thus getting the reader to open up A third important story may begin on Page One and jump to the inside There is likewise usually a secondary picture on the front page, covered in a cuthne In criticism of this page it might be said that, while it is interesting and has poster value and selbing power, it is not given the coter value it should have, that is, the front page does not serve so much as it might to get the reader into the paper Photographs with cutlines referring to stories on the inside pages would do that job better A third story on so small a page might well be climinated to make room for bold bulletins advertising several of the biggest stones and features the paper contains, with page numbers where they can be found

One story carried on the front page of a tabloid can have value, if only to distinguish the serious tabloid from the more sensational

one Visual impressions produce strong psychological reactions Many people who unconsciously associate the word "tabloid" with less dignified handling of the news can he won over to this more convenient format simply by seeing stories of a more important nature headlined and a certain amount of body type on Page One It takes the newspaper out of the "picture paper" class for them

Usually two pictures, one large and one secondary, will be enough for such a page If a 3 column picture is used on the left. the lead story will take a 2-column lead on the right A 3-column may be used in the center, with two stories in 1 column on either side. A horizontal news shot can be splendidly displayed on such a page in 4 columns, with a 1-column lead on the principal story A 3-column horizontal will probably look larger on a page with type than on one using only pictures, and a 3-column unright will be most effective. The secondary picture should be placed to create diagonal feeling in the layout and can he 1 or 2 columns wide, horizontal or upright Instead of the secondary picture, a short 1 column personality strip of three heads, fitted into the outside column or into the fourth column below a hold face 2 column lead on the hig story, with cutlines under each picture referring to a different page of the paper, would give the front page excellent cover value

In comparison with the News in Washington, the New York Daily News is much more conscious of the function of the front page to lead the reader into the paper. Not only is the layout treatment more dramatic—perhaps too dramatic for the Washington paper's needs—but the headline carries such a reference line as "Story on Page 3," and the pictures carry similar references. When layout permits, a bulletin is used announcing other inside stories and pictures.

A tubloid must not of course forget the class of reader to which it is directing its appeal, but quite within its own field, it can seek a maximum of cover values for Page One

#### A APPLICATION EXERCISES

1 Take a recent copy of the New York Times Either paste together copy paper to make a layout sheet the size of an 8-column newspaper page or secure a similar sized Bristol board or piece of wrapping paper. Using the news feature and editorial contents of your selected issue of the Times and so far as possible the piectures in that issue, layout a front page in such

a way as to attract readers to buy the paper and to read as many as possible of the inside pages, by the use of a A vertical strip of thythmically sized pictures (determine your own

- dimensions) with cutlines to direct readers to stories, features, or editorials or further pictures on inside pages,
- b A blurb article, giving hulletins of inside page material indicating where full treatment will be found.

c A 'diagonal feeling" makeup,

- d The biggest story of the day handled with reasonable completeness on the front page, including an instantaneous effect news picture,
- e A brief but effectively presented direction as to where a full table of contents will always be found

Do not use the "bull's eye' rectangle device in this layout Fill out your layout, if room remains, with what you think will most effectively follow the principle of "giving the reader less—yet considerable—on Page One, and promising him more" on the issue pages

- promising pure from the inside pages

  2 On a similar sized layout sheet, using the same contents of your
  selected issue of the New York Times, lay out a front page along the lines
  used by Gilbert P Farrar for the May 1, 1937, issue of the Toledo News Bee
- 3 On a third layout sheet, using the same contents, lay out a front page after the manner of the May 24, 1937, issue of the New York Evening Journal—the four-quarter plan

4 On a layout sheet or Bristol board the size of the New York Daily

- News, lay out a tabloid front page of the New York Daily News style, using picture or pictures from your selected issue of the Times, indicating the desired blowup and writing your own headline from news in this issue of the Times.
- 5 Indicate in a typewritten statement of not more than 500 words one or two ideas of your own, not explained in this chapter, which you helieve might be favorably accepted in your home town, or college town, to give the leading newspaper of that town greater poster and inside-page value

Do not suggest things in any of these exercises which are impracticable with respect to modern printing equipment or advertising agency restrictions (see Chapter XI, "Page Layout")

## B CHAPTER ORGANIZING QUESTIONS

1 What advantage is there in having headlines flush to the left? What is the advantage of upper and lower case headlines over all-capital headlines?

2 What should be guarded against in dropping column rules?
3 In what way have conservative magazines like the Atlantic Monthly

3 in what way have conservative magazines like the Atlantic Moning and Harper's Magazine long been shead of newspapers in giving readerinterest value to the pages which contain the advertisements?

4 Why will jumped stories not lead readers into the inside pages?

5 What is the psychological reason for playing up the biggest story of the day on Page One and making all other stories minor in treatment of that page?

- 6 Describe how samples of the best news picture coverage for the day may be displayed on the front page
- 7 Explain how candid pictures of people in the news can be made a semipermanent feature of Page One
- 8 Explain how horizontal bands of action or personality pictures can be used on the front page Explain any objections you may see to doing this for certain papers and certain clienteles
- 9 What restrictions are there in displaying news pictures in tabloid size papers? How have tabloids attempted to combat these restrictions? Cite at least one illustration which actually occurred
- 10 Why is a photomontage of pictures from several news stories not suited to front-page display?
- 11 What is the essential difference in front page display used by the New York Daily News and the Washington (D C) News? Why is each policy probably better suited than the other would be for the particular clientile involved?

#### CHAPTER XVII

## LAYOUT ON INSIDE PAGES; MAKING IT SERVE THE ADVERTISER

#### PREVIEW QUERIES

Why are advertisements in many newspapers banked in "pyramid formation" in the lower right-hand corner of inside pages? What objections may be offered to this plan?

Do your own reading habits, or your observation of others', support or reject Dr George Gallup's statement that "We have developed a nation of front-page readers"?

Why are inside pages sometimes referred to as the "dust bowl" of journalism?

If the "glut of occurrences" which makes the variegated and complicated news in large newspapers were presented under departmentalized beadings such as "National News," "Foreign News," etc, would it please or displease you?

What objection is there to departmentalizing news on the front

page?

Why is it difficult to present the background of complicated news if all major stories are begun on the front page? How does a com-

petent presenting of "background material" increase reader interest? How may news be reasonably departmentalized on inside pages

without deadening the appearance of the makeup?

Can you think of a way in which advertisements can be placed on 5-column inside tabloid pages to secure effective display without pyramiding?

THE proper handling of inside pages of the daily can only be decided after front-page procedure has been determined. If the newspaper is one which still jumps many long stories from Page One, space for these jumps will naturally have to be found on the inside. If it is one of the forward-looking papers which realize that this cumbersome method is ineffectual from the standpoint of reader reaction, then it will have cleared up its front page in one of the ways described in the preceding chapter, or in some other fashion suited to its needs, and will be ready to go shead with plans for more effective pages inside.

The picture presented by many inside pages today is that of a numble of large and small ads pyramided in the right-hand corner, a few heads at the top, and the bottom of the page below the fold ruled off for jumps Often a one-word jump head is used. because it is easier to find the jump in this fashion than if it carried a news head. The jump head in itself has no visual interest or attraction, the long jump from the front page is frequently broken only by a few small subheads, and so the part of the page below the fold and next to advertising must strike the reader's eye as a gray, dismal waste, or, rather, it is so neutral and self-effacing in appearance that he never consciously glances at it When, to can the climax, the ton of such a page carries early "filler" stories sent over the wires by the press associations. with 1-column heads and no pictures, or at best a 1-column cut out of the newspaper morgue, the reading interest on the page is nil and its graphic appeal is nonexistent

There are few editors who do not complain that they "haven't enough room for all the news" There are some who cost their paper large sums of money by having many columns of dull early copy set and proofread by the composing room and made up in the forms for the first edition, only to remove it and "kill" it before the second edition. It is not the purpose of this book, but of cost experts, to figure the appalling financial waste represented by daily overset (unimportant stories which were set in ease needed, but never used) and by stories so slight in content that they were "killed" after one edition. When it is considered that this waste finally creates pages so lacking in appeal that they are never read by any but the most diligent, there would seem to be basis for the charge that the editor has more news space than he can handle, rather than too httle

# DIVIOE THE ADS

Briefly, what such pages need is more thoughtful treatment from top to bottom. Ads should wherever possible be divided into two groups, at either side of the page, instead of being pyramided in the right hand corner (Fig. 29). Instead of jumbling large and small ads, a better arrangement can be sought through out the paper by combining ads of similar column width so that they extend from top to bottom of the page (Figs. 30 and 31). Thus the edge of the page might show a 2 column strip of ads,

while the fold might show a 3-column ad, or a 4 column ad at the bottom and a strip of 1-column ads running to the top. The ads themselves must determine the patterns used. A number of small ads may be combined into a single large block. The idea is to bring reading matter down through the page, to separate the ads, to provide increased bottom of the page interest, and to get more adds above the fold, where they stand a better chance of being seen

Every newspaper office is receiving today numbers of news photos from the press associations which do not "make the paper. Staff cameramen often take many more which are never used. The reason frequently given is lack of space. Yet scrutiny will prove that the news content of a large majority of these is higher than the content of the filler stories used. In addition they have the property of being able to spot the page graphically giving it a visual appeal and "pulling power." Column for column halftone engraving costs less than composition of reading matter. There is therefore little excuse for the dull pages we see

The editor dummying or making up inside pages should plan to use a newsphoto or a simple layout of one or two pictures wherever there is room for it at the top of the page and to make use of pictures at the bottom of the page when this is possible, for there is no better way to draw attention below the fold (Fig. 32) of course a halftone should not be placed against an ad, except in instances where lack of space makes it advisable. Where the ad is large, light, and open in effect, and a small, darker balftone offers contrast of size and tone values, it may safely be used A silhouetted I-column face will stand away from an ad that has a halftone background. The tabloids need to make use of such arrangements, large-format papers may occasionally do so to break up a type mass.

A cut which is 112 columns in width can sometimes be used close to an ad to good advantage, using ½-column entines to separate it from the ad, with plenty of white space above and below the caption. A full 2-column overline will look best in such an arrangement. Layouts of two separate cuts, each of which is 1½-columns wide, can be used advantageously on pages with ads, for they can be brought close together to give a 3 column spot, stepped off to accommodate the arrangement of the ads, with cuttines in one or both of the 1½-column mortises thus cre-

Fig. 29.—The departmentalized paper gives advertisers a better break, by placing important stories on pages which carry sads. Note the eds are separated to left and right for better attention value, with pictures used to draw the eye below the fold.

ated (Fig 30), separated entirely to give two spots in the page layout, or, finally, one can be dropped if the page becomes overcrowded with ads

When pictures are used at the top of the page, they should carry an overline unless they are placed just below a banner line, when the overline should be dropped and only underlines used Some papers use banners on inside pages, but most do not However there should be head type across every column, and no stones should be turned into the next column "blind," that is, without a head The darker head type across the top of the page. with picture layout and cutimes in bold face, gives the page increased graphic appeal. This top of the page layout draws the reader's eye, which must then be led down the page by proper spotting of the columns If numps must be used, they might be relieved of their gray typography by setting all quotes, or at any rate some paragraphs, in boldface and possibly in larger type and by breaking up the type matter with subheads It is better still to have one or more important heads at least in 24 point, below the fold

Sometimes a regular daily feature column of popular interest may be used to run down beside or between the ads, its typography broken up by lightface and boldface paragraphs and subheads and by a 34-column cut of the columnist or a senes of 34 column cuts, placed alternately to left and to right, or in groups of threes (see Fig 384). Everything that can be done to take the bottom of the page "out of the gray" is apt to help keep the newspaper publisher "out of the red"

Of course, one thing that has worked against better treatment has been the necessity for closing many pages of the paper early All pages cannot be held open until the last story is in type Several hours before press time the flow of finished pages to the stereotypers may have to begin Editorial pages, woman's pages, and any other pages which have not the timeliness of log news usually begin the procession. Then follow the inside pages earrying news and advertising. As soon as advertising composition and makeup on a page are complete, the editorial man tries to place enough stories to fill it up and left it go. For the express purpose of getting rid of the back pages be has probably seen to it that plenty of early copy was set, and this he orders into the forms, with little regard for its content or reader pull

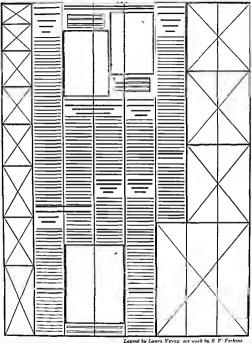

Fig. 30—Modern layout for an inside page. Ads are stacked to left and right in panel arrangement the small ads separated from the larger ones. News cuts in 1½-column width ofter flexibility. They may be combined as here or one may be dropped and cultimes used in ½-column measure. Interfocking heads and art lead the eye below the fold

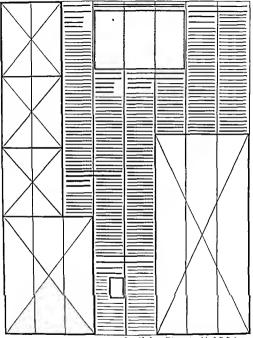

When that sort of editorial method is followed, it not only results in a dull newspaper but in the necessity for hreaking open many hack pages hetween editions, to get some of the dead wood out Make-overs and replates cost the paper more money than it would seem at first sight When practice runs to a great number of them, there will he a larger composing room force, more stereotypers, and more pressmen

Getting rid of the hack pages may be an important problem, hut it is not one that can be rightly solved in a trice, while the stereotypers and printers wait for the words of wisdom to drop from the editorial man's lips The problem goes far hehind that, to foresight in providing really interesting feature stories and pictures and other matter which can make the pages carrying advertising alluring. In this respect American newspapers can learn many lessons from the more popular English newspapers, most of which separate the ads in the manner we have described and use great variety of pictorial and typographical device to make pages with ads lively and spritely in appearance Stories are hrisk, short news items or features, chosen for their dramatic or human interest values. They are enlivened with good newsphotos and with interesting typography 10 and 12 point type is used, paragraphs are set in boldface, headlines employ an underline We are not defending these English papers particularly for the clean-cut display qualities of their page layouts. They sometimes run to the extreme of overdisplay, which makes them appear numbled Yet they do not have the dullness of dreary gray typography to be seen in our own great "inside page dust bowl" of the news

### IRRIGATING THE DUST BOWN

Here and there in this country editors have heen experimenting with the dust boal and trying to find solutions for its drought Close on the heels of the English papers are the Des Moines Register and the Des Moines Tribune, with shorter stories, more pictures, and greater typographical interest. Ada are still pyramided and stories are jumped from Page One, but an effort is made to get layout interest below the fold by means of pictures, larger heads, and holdface type

A radically different remedy has been sought by the Richmond (Va ) Times Dispatch, which plays a variety of hig news stories

Layed by Lawa Vitray a twork by S F Perkini

The 31—1 modified panel arrangement of ads If the advertising department
dummines and of similar sizes on a page the small and sull not be overshadowed by the
large ones. When small ads are stacked beside large ones often they get few results though
a large block of small ads my have good pulling power

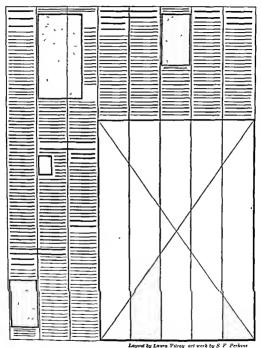

on the front page briefly and witbout jumps, and departmentalizes all other stories under such bendings as "National Affairs," "Lubor," "State and City," etc., so that the inside of the paper is reminiscent of Time magazine (Fig. 29) Department heads are set between parallel rules at the top of each page, and stories carry regular news heads, without banks. This has the advantage of scattering short news stories through all the pages. That is a step in the right direction, yet it seems very doubtful whether a makenp directly imitative of Time is suited to a large-formatically paper, which is not handling a digested summary of last week's news, but today's news as it occurs. The news magazine treatment has become associated with past events in many people's minds, and that is an excellent reason for avoiding it

We pointed out in discussing front-page layout that a depart mentalized treatment copying that of the news magazines would take the pulse of life out of the news that is breaking and reduce big, dramatic events to a rigid form when would interfere with their reader appeal and with their play according to relative news values. Some believe that American editors have gone too far in assigning to themselves the power to decide which stones are "ling" and which are "small" and that such treatment of vital problems amounts to editorializing. Perhaps the criticism is justified, yet there is a healthy enthissism about playing the news for its big crises and dramatic surprises, which does sell papers and does hold the reader's attention. What our papers need, if they are to continue in existence in the face of radio and newsreel competition, is more drama and not less of it.

The attempt to departmentalize news on the front page is mistaken, because it deprives the big stories of their proper play When we move the news to the whole inside of the paper we have more room, and sorting and classifying is no longer inconsistent with dramatic presentation. News magazine makeup is not dramatic enough and should not be untated even here

## BETTER SORTING OF MATERIAL

The horizons of news bave broadened immeasurably even in our generation. News pours in on us from everywhere, and we need more system if we are even going to attempt to understand what it is all about. Our own interests and sympathies have been rapidly broadening since the World War and the depres

Fro 32 —Pages with large ads are easily spotted?" fart was ordered in convenient sizes
Cuts in 1/2, 1, and 11/2 column widths are easier to place than those in wider measure

sion We really want to know about things that are happening in Paris and in Shanghai, in the cotton fields of the South and the coal mines of Pennsylvania, in Wall Street and the Supreme Court and the President's office. We want to know, too, about the airplane that plunged into a mountainside, and the reporter who circled the globe in 7 days without getting a scratch. We are intensely interested in royal romance, but also in the poor mother who killed her baby because she had no food. What is more difficult still, we no longer care to picture all this as a kaleidoscope, but we wish to be able to discern how it all fits into the portentious or the hopeful destiny of our modern world. That is reader reaction at its best and most intelligent, and it includes many millions of Americans today. For them, a news hodge nodge is not quite good enough.

We have got to plan the whole paper better, bringing related stories closer together and emphasizing these relationships by proper grouping, by pictures and layout and typographical aids. This is one urgent reason why the hodgepodge front page has got to go. When we move the news inside the paper, we can sort it better, although we do not need to force it into a rigid layout mold, as the news magazine makeup would do. We must eliminate "filler" because the reader does not wish to be bothered by unimportant stories, but we must not deprive him of real human-interest news. We must plan to give him more of the news in pictures, because newsphotos tell him a bost of things which words cannot. They make him realize the news.

In a paper such as we envisage, stories relating to national affairs will be grouped together, on a single page if possible. The same will be done for labor, for foreign affairs. Otty news will have its own grouping and may extend over several pages. Human interest features and pictures will enhiven the makeup of all these pages. The news coming in over the wire will be culled for at least one high-light story of a personal or dramatic or humorous nature that can be given special treatment in the page layout to lift it out of an appearance of hard reading. Reporters on the city staff will be given assignments of this nature, too

We may be deeply interested in national affairs, yet the page presentation of such news may look so pedantic, so voluminous, so dry as dust, that we shrink from attacking it The impression is probably borne in on us by too much small body type that is

hard to read, too many unbroken type masses, too little headline display, not enough pictures, not enough "rehef" in the way of stones in lighter vein, so displayed in the layout that we know they are there for us Take the same page and give it a picture layout with motion, reasonably hold and black heads for the higgest stories, which are treated with 14-point holdface, doublecolumn leads, and part of the story in 10 point, hox on the page a boldface summary of the whole national news situation, including something of what led up to the events today, boil the less important stories down so that they do not bore or frighten us by their length, and place at the hottom of the page a humorous side-light story of how the President had his tooth pulled or how the White House dog ran away, with a picture if you have one Suddenly the affairs of the nation, which in fact concern and interest everyone, become something palatable which everyone desires to Take the same material and run it in uniform typography under a heading "National News," with small uniform heads for the separate stories Now, on a large-format page, it looks like something to study, perhaps important but only to be attacked when the reader has plenty of time He loathes lessons anyhow, even when they are vital ones, so he will probably skip it

Some editors imagine that some of the news, like politics or foreign affairs, is "or er the heads of many readers, especially the women". The answer is that all people are interested in what affects them. If it does not affect them, why publish it? What is its purpose? Yet the stories themselves, however they concern the reader, only speak to him if he reads them. Layout speaks to him before he reads. One manner of treatment whispers to him that this is formidable material which only a superman could understand, and that he had better let it alone unless he has a university diploma. The other kind of layout does a real joh for him, making things he ought to know stand out so his eye spots them and suggesting to him by its whole visual appeal that here is something meant for him.

Women as well as men will read that kind of page of national news, or foreign news, or whatsoever the news may he Surveys of women magazine readers in all parts of the country have shown that attractive illustration and layout for a magazine story or article will send the reader interest to a high level, whereas a story, even by a favorite author if hadly presented, will be read only by a comparatively small group This psychological importance of layout and presentation cannot be overemphasized

The modern newspaper should sort, classify, and coordinate the material for its inside pages. It should give every page definite layout appeal. If it does the first and not the second, it may go backward instead of forward in the matter of getting the whole paper rend. Departmental headings, breaking into page layout, dam up the free flow of the makeup and roh it of dynamic qualities. On the other hand, there is no good reason why the kind of news on each page should not be indicated in a word or two of small type to the right or left of the date line in the folio, just as the New York. Times does in its Sunday sections, as an aid to the reader in finding rapidly a page he wants (Fig. 33). Ten point lightface capitals should be large enough for such a classification which should not "spot" the layout at all

# BACKGROUND OF THE NEWS A FACTOR IN LAYOUT

Taking the big news stories into the inside pages makes it possible to run them without jumps and with picture. It all o permits space for the "missing link." in news coverage today the background of today's events. We mentioned the possibility of using as an element in a page of national news a boxed summary of related events, or an explanation of previous events which led up to the general situation covered in today's stories. Help of this sort is needed if the reader is expected to grasp much of the complicated information, political, economic, technical, etc., with which the press bombard him. He may not be a financier or a political economist. He may have missed yesterday's development and so not understand today's. If he is not a research chemist he may be frightened if he is told that "oil extracted from whole wheat caused cancer in 100 per cent of the rats on whom it was tried," for he may not previously have followed the scientific news of such experiments.

Fiction serials in magazines usually carry a bold résumé of "the story so far" History as reflected in current events is another kind of serial story, requiring much the same thing The Washington Star first experimented with boxes of background information inserted in the type of front page news stories Other newspapers have followed its lead, because the idea answers a modern demand which only the news magazines had been

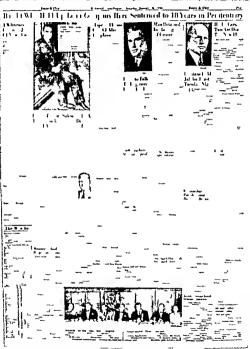

Fig. 33—Departmentalized pages can avod r guilty by running the group heading or class feat on of the news as part of the dateline of State and C ty

supplying The front page, bowever, if erowded with all the hig news, has little place for this too When we group stones together in their right relations inside the paper, the background hox can be given more scope and can also become a factor in spotting the page

We have suggested radical changes in the newspaper, in order to produce an organ more suited to modern needs, one which will do its job better for the reader desiring intelligible information and for the advertiser who wants to insure that his ad will be seen Briefly, all these changes may be summarized as follows

Front Page Dynamic layout featuring the one big story of the day and using headlines, blurbs, and newsphotos to entice the reader to the inside of the paper

Inside Pages News grouped and classified Advertising no longer pyramided at the right, but separated into two panels, left and right of the page Strong layouts depending on good headline display, newsphotos, and text type showing variety in size and tone and well broken up by suhheads "Spotting" for the page layout at the hottom as well as at the top

## Some Practical Aspects

Let us see what are the practical aspects of such suggestions. To begin with, a new plan for stacking the ads in the pages is a matter, not for the news room nor for the picture editor, but for the advertising department or, perhaps, the general manager. The advertising department dummies the ads into the pages and furnishes these dummies to the news room, as the first practical step toward building the inside pages of the paper. The ads are the physical starting point of each page, and it is not the editorial man's privilege to alter their arrangement. Any new plan for the paper will therefore have to be worked out carefully in advance, have the approval of the general manager or publisher and the cooperation of the advertising department. The managing editor or picture editor desiring to give his paper a modern lay out and better graphic appeal may have to do some poncering and persuading first. In the end it will have been worth his time.

### RELEASING EARLY PAGES

Releasing early pages to the stereotypers should he no more difficult with a classified newspaper than it is today. Some classifications will have to be kept open to the last minute hecause a hig development is expected in a particular story, but others will be complete early and the pages containing them can he locked up and let go If the news and picture editors have conferred on this matter earher in the day, it will have been possible to plan for some of the pages to be complete early, with both stones and cuts From the standpoint of replates and make-overs, such a system will save money The paper which jumps all hig stories from the front page must not only open up the front page for each new development but must tear up the jump pages as well With the news well sorted, it will be discovered that most pages can stand through all editions The public is not following every little hourly development in every little story from far and wide Only a few of the most vital and dramatic developments interest it, and the rest can safely he held over for tomorrow's paper

As we pointed out earlier in this hook, the newspaper is no longer the spot news medium. The radio has taken over that function. Big spot news should of course he gotten into the earliest possible edition of the paper, but there is no real need to change the lesser stones constantly. Editors do so hecause they hope in this fashion to have a paper that is fresher and more interesting than their competitor's. This purpose could be readily accomplished by spritely layouts and good newsphotos with stones that had heen carefully selected for their popular appeal.

Many newspapers today are agreeing with their competitors to reduce the number of daily editions, which represent staggering costs and still do not bring the reader the hig news as rapidly as he can get it over the radio. What the public wants of the modern newspaper is a follow up on the radio flash, one which gives through coverage in words and pictures. Russhing the paper onto the street with a one-paragraph bulletin does not always result in sales which compensate for the expense. Where there are fewer editions, there will he more time to give every page graphic appeal, which in the long run will he much more impressive to the reader than changing many secondary stories in each edition.

We have spoken of the expense to newspapers of type that is overset or that is killed after one edition. When more news-

photos are used it will be discovered that they do not involve a proportional overset loss. News that did not make the paper is dead, but many newsphotos will still be interesting to the public tomorrow. Of course if the opposition gave the picture a big play it will have to be killed. Otherwise it will be good tomorrow. The reader is conditioned to the idea of seeing the picture somewhat later than he hears or reads of the event. He goes to the newsreel theater for this very purpose. Days or weeks after the event he examines with and interest the newsphotos from China from Germany, from the explorers at the South Pole. The time element can therefore lag a bittle in published pictures without any loss of reader interest.

Even as filler for back pages cuts are more economical than type. They seldom need to be killed. Sometimes editors forget to use the cuts they could not get into today s paper, which they ordered held in the composing room. For this reason the picture editor or managing editor should have a complete list of all cuts with the pages for which they were ordered each day and should check this against the paper. A small report slip can be sent to each editor who ordered a cut which did not appear, raking him if it has been killed if so, why, if not on what date he expects to use it. Such a system will halt waste very successfully

#### NEWSPAPER ALBEADY PARTIN CLASSIFIED

From a practical standpoint there is nothing unprecedented about classifying all stories in the paper Classification already Sports news is not scattered through the paper at random, wherever it can be used to fill a spot, nor are society news or women's features Editorials and editorial features have a page, sometimes two pages, of their own The same selective handling can be extended to the whole content of the paper Greater mobility is essential to news pages and changes of layout must often be decided hastily This does not mean that the makeup of the page should be left to the sudgment of the printer If the editor in charge of makeup has a thorough understanding of the rudiments of display, he will be able to see at a glance how to recompose the elements of the page to exclude old material and include new and still maintain display that is effective

#### TABLOID INSIDE PAGES

The tabloid inside page with advertising presents its own variety of problems, not always well solved, because they are more difficult than those of the large format. The layout man is required to give interest to reading matter on a 5-column page which may carry 2, 3, or even 4 columns of advertising. When he uses newsphotos he runs the almost certain risk of their colliding with the ads. What can he do about giving such pages reader appeal?

To begin with, tabloid faving pages should be treated with the idea in mind that they will be seen as an ensemble much more than will two large-format pages. Such an approach will have an important effect on the placing of the ads. In this the tabloids could learn valuable lessons from magazines which nearly approximate them in size. The old ineffective way of placing the ads is to stack them pyramid style on the right of each page. There are several modern ways of placing them, depending on size of the ads (Fig. 36).

Ads more than a column wide can be placed on the outer or left edge of the left hand page and the outer or right edge of the right hand page, leaving a block of type matter in the center of the 2-page spread (that is, type next to the fold on each page). This space, if large enough, can then he given a layout with motion or can be regarded as a visual unit. Of course, this is not to be construed as a suggestion that either heads or pictures extend across the fold, which they can seldom do. We are merely suggesting that graphically this space be regarded as a unit. For this it will be helpful if page dummies of facing pages are prepared at the same time. With the ads so placed heads and pictures can readily be dummed into the center space in an arrangement which has balance with motion.

Ads may be effectively placed on two facing pages in vertical strips, with columns of reading matter falling between them for instance, the right hand edge of the page on the right might carry a full 3 column ad, with 2 columns of reading matter on the fold, then a full column of 1 column adds on the fold of the left hand page, a column of reading matter next to it, then a column of ads, then reading matter, and finally a column of ads on the left-

hand edge of the page This "striped appearance" gives the ads better display and can be worked out in various ways according to the needs of the case Or the ads may simply be divided into three groups on the double-page spread, as in Fig. 36

It will be unnecessary to give any pictorial display to single columns of type running down between the ads on such pages, for the ads themselves create a sufficient layout pattern. However, these will be good spots for important stories, starting with strong 1-column beads at the top of the page. Depending on the ads to be placed, the type spaces on some pages will be wider Running from left to right on two pages we might have 1 column of ads, 3 columns of reading matter, 1 column of ads, 4 columns of reading matter and 1 column of ads. We could then place puttures in the 3-column and in the 4-column reading spaces.

To sum up these suggestions (1) Ads may be placed to left and right on two facing tabloid pages to create a center reading space, (2) they may be stacked in full columns of varying widths, creating alternate stripes of advertising, or divided in three groups across the two page spread Layout with newsphotos will be done in the larger reading spaces, but the single-column spaces will be devoted to reading matter alone.

#### HALFTONES FOR THE TABLOID

Because of its limited space the tabloid has been forced to greater ingenuity in the use of pictures. Sometimes its devices could be studied to advantage by the large-format papers, if only as possibilities of variety

One-column cuts and %-column cuts are made in two styles regular oblongs with dark backgrounds and silhouetted heads. The latter give white space in a crowded page and can be placed beside advertising with less confusion to the eye. Large newspapers might use them to break up narrow type masses running down beside the ads. Silhouetted half columns are also light and hively in effect and can be used to spot a column of type incely, placed alternately to left and right down the page.

The 1½-column cut, with ½-column cutlines on the side, is a tabloid standby. It accomplishes the double feat of reducing the picture to a space much smaller than the 2-column width would occup, and at the same time providing a little "arr" or white space in the page layout. The average 1-column cut used

hy most papers is about 2½ in. in deptb. Tabloids, being obliged to use many 1-column cuts, often vary this with a short length (about 1½ in.) and a longer one (about 3½ in. or more).

Dramatic newsphotos involving action are less used in the tabloids today than they should be, largely hecause they seem to take up too much space if given a proper play. The picture which would be given a 4-column spread in a large paper cannot get that play on tahloid inside pages A good solution to this problem is to use "half-size" illustration when the newsphoto is good enough to permit the reduction In other words, the horizontal which would normally he given 4 columns becomes a shallow 2-column cut. The picture which normally would he played in 3 columns also is reduced to a 2-column cut. These greater reductions would result in halftones which looked too diminutive on the large-format page, except for certain kinds of layout They suit the layout of a large-format Sunday news review very well, for instance. On tahloid pages their proportional size is greater and, if well selected, they will reproduce with plenty of detail Tabloids are apt to run to too many 1-column cuts, because these are most convenient to place. They also, however, become very monotonous with overuse.

#### A APPLICATION EXERCISES

1 Obtain one copy each of two current metropolitan newspapers Ignore the front pages Examining all inside pages except editorial, sports, society, and woman's pages, list the number of pages in each paper which contain no more than one 2-column or smaller picture, which contain one orner "jumped" stones from elsewhere in the paper, and which have at least three top heads devoted to stones of comparatively low reader interest, probably early filler copy. Now list the numbers of pages, with exceptions noted in this excrete, which have of least two 2-column or larger pictures, no jumped heads, at least four topheads which seem to you to have high reader-interest value for the readers of that particular paper, and at least one 2 or more column head or other graphic means of attracting the eye below the fold. Be prepared to discuss the comparative reader interest of three two types of inside page.

2 Take two pieces of Bristol board or wrapping paper or blank newsprint the size of the pages in the two papers called for in Exercise 1. Eliminate from your consideration the spot news story, the human-interest or personality story, and the one large blowup picture or the three smaller pictures which you consider of greatest reader interest in this paper. Of what news remains in that particular newspaper, lay out two facing inside pages with a makeup which you helieve would induce a majority of readers of the paper to read them. Indicate the contents of the news photographs hased upon

news actually contained in the paper for pictures indicated in your layout, if adequate pictures do not actually appear in the copy of the paper selected. In these two page layouts, rearrange, if necessary, such advertising as actually appears on two inside pages of the paper which you use

3 From one of the copies called for in Exercise 1, list all inside pages, eliminating those excepted in Exercise 1, which classify in any way at all the news contained on them as suggested in this claspier of blank paper lay out one inside page which contains some classification of news which you did not use in accomplishing Exercise 2 Use only news which actually appears in the newspaper you select

#### B CHAPTER-ORGANIZING QUESTIONS

- 1 What advantage is there in dividing advertisements on inside pages, and in placing some of them at the top of the page?
- 2 Why should photographs be placed, when possible, below the fold of an inside page?
  - 3 In what case may a baltone be placed next to an advertisement? In what case should it not be so placed?
- 4 How may layouts of two separate outs, each 1½ columns wide, be used advantageously on inside pages, and where in so using them should the cublines be placed?
- 5 What is meant by turning a story into a column "blind"? Should it ever be done? Explain the reason for your answer
- 6 If a regular daily feature column is used on an inside page, how may its typography be livened, and where may it be placed on the page with particular commercial advantage?
- 7 How may a 1½ column cut be used in a 2-column space on an inside page without using an underline below the picture? What advantage is there in this method over the device of placing the caption beneath the picture?
- in this method over the device of placing the caption beneath the picture?

  8 What disadvantage is there in a newspaper's imitating a magazine's
- treatment of department headings for dady news?

  9 Is there any definite evidence that a good news atory or feature article
- will get more readers through attractive illustration and layout?

  10 What metropolitan newspaper first experimented with the presentation of background information in front-page stories? What method of presentation did this paner use?
- 11 Explain why and how hackground information may be more effectively given the reader by a paper which adopts the policy of playing only one or two hig stories on the front page and putting the rest of its big news on inside pages.
- 12 Why need the advertising department and the general management of the newspaper he consulted before the makeup editor can order a pyramid plan of stacking advertisements changed to a two-panel plan?
- 13 What different and more difficult problems does the tabloid format present in using panel or stripe advertising makeup? How may this difficulty be solved? What more difficult problem for making up with half tones does the tabloid format present than is encountered in the 8-column page? How may this difficulty be solved?

#### CHAPTER XVIII

# EDITORIAL PAGE LAYOUT, SPECIAL PAGES OF THE DAILY

## PREVIEW QUERILS

How many newspaper editorials have you read in the last week?

How many newspaper editorials or editorial features which started below the fold of the nage have you read in the last week?

On how many occasions during the last week have you read as much as half of the editorial material which appeared on a newspaper editorial page?

Turn the pages of any recent copy of a daily newspaper published outside New York City, Washington, D. C., or Des Moines, Iowa Does the editorial page entite your eye by its physical appearance apart from any reputation this particular editorial page may have earned with you his sheer yourse of melletual content?

Ask the above questions of any five adult persons who are neither journalism students nor newspaper workers. Compare their answers with your own. To what conclusions do these data make you tend?

How many times in the last week have you read as much as 2 columns of non-advertising matter on the first page of any inside section of a daily newspaper other than sports?

What if anything on these "split" pages has induced you to read inside pages of that section?

How many times during the last week have you read more than one story on a woman's page? On a society page?

Turn the pages of any recent copy of a duly newspaper published outside New York City Do the split pages, the society page, or the woman's page entice your eye from the standpoint of physical appearance?

How many times during the last week have you read the picture page of a newspaper?

How many of these picture pages have contained one or more local pictures? Do you habitually read all the underlines on picture pages?

THE editorial page and other special pages of the daily afford time for careful layout and therefore should be strong in presentation Editorials may have dignity, but need not look forbidding. The average editorial page has an aspect that is utterly dreary. Its art often consists of one political cartoon in

the upper right-hand corner, with neither display heads, newsphotos, nor variety of typography to relieve the grayness of a sea of text type Such dullness may correspond to pedantic leanings of the editorial mind, but it is not entiring to readers

If the editorial page carries no advertising, it is one page of the paper which should set an example of dynamic layout. The elements out of which this layout is huilt are the masthead, the editorials, one or more cartoons, letters to the editor, special columns, and, in the modern page, newsphotos

The masthead, required by the postoffice, contains a statement of ownership, officers of the newspaper, its press association affiliations, subscription price etc. This small block of type licaded by the paper's name, is sometimes given more interesting appearance by use of a small line cut. Well handled it hecomes a factor in spotting the page layout

Many newspapers use a wider column to set off the editorials from the rest of the material on the page. This can he accomplished on an 8 column paper by redividing the 4 columns on the left into 3 columns The World-Telegram uses this method and drops the column rules out of the space devoted to editorials while retaining them in the other 4 columns The cditorials are set in 8-point Bookman on a 10 point slug, instead of in the regular hody type, thus giving them a slightly darker and stronger appearance in the layout They are blocked off into a space in the upper left hand part of the page, extending well helow the fold This is a good idea, for it makes the editorials a definite spot or ohlong which can serve the purposes of the page layout The column which occupies the space below this block carries a 1/2-column cut, and there is also a secondary cartoon at the hottom of the page The New York Post resorts to boldface indented paragraphs to increase the graphic appeal of its edi torials, which occupy 2 wide columns down the left-hand side of the page Its cartoon is moved away from the fold, to allow for a 1-column feature on the right of the page There is also a small humorous cartoon spotting the page at the bottom and there is more display type on the page than usually appears The Des Moines Register breaks up the layout of the editorial page with 2, 3, and 4 column heads, with a variety of 16-column cuts and an occasional small newsphoto Boldface paragraphs help to relieve the gravness

All these and many other editonal pages are reaching out toward some more interesting presentation, yet none of them can he said to have achieved anything that is outstanding in its effectiveness. Improvements of one sort and another have been made, but page layout as a whole is more a matter of accident than of design. Good typography is once again not sufficient to a right solution of the modern newspaper's problems, though of course it is a step forward.

The English newspapers show vigorous treatment of editorial page layout, lifting it out of the humdrum altogether (Figs 43, 35, and 36). They use large type faces for heads on editorials and features on the page, and they use newsphotos to create an ensemble that has halance with motion and hold poster effect. Ten-point body type, plenty of white space, boxes, and underlines all help to create a presentation which has variety, spritcliness, and strong reader pull. American approach to editorial page layout is perhaps too timid, too awestruck by the ponderousness of the opinions the editorial writers have set forth. Most editorials deal with significant phases of news printed recently in the paper. They concern live issues and have no reason to look so dull.

There are very few editorials which could not be accompanied by news pictures, either of action scenes or of personalities who are making the news today. At present even ½-column cuts creep into the page apologetically. One and two column cuts, hold overlines, and headlines would inject new life into the presentation. This page, more than any other in the newspaper, should approach the front page in poster value. There is time to prepare it and nothing to interfere with its heing the most striking page in the paper.

Some don'ts for hetter editorial pages are (1) Don't have blind columns at the top of the page, their effect is weak (2) Don't run the cartoon at the top of the page without an overline (3) Don't allow the page to be a sea of gray, that looks impossible to navigate

Positive advice for the modernized editorial page is (1) Use newsphotos and cartoons to spot the page in a layout with motion (2) Use enough head type on the page to hreak its monotony and make the heads large enough to do just that (3) Use holdface paragraphs or subheads or some other method of hreaking up type masses (4) Aim at an editorial page that looks like interesting reading, then it may get read

#### IDEAS FOR SPOTTING THE PAGE

Once the layout of the editorial page is done by a person who has in mind giving it strong graphic appeal, a great number of possible layouts will be devised. The layout may be varied from day to day, or a pretty habitual pattern, if it is dramatic enough, may he followed regularly. No attempt will be made bere to suggest all possible forms the editorial page can take, yet a few ideas for layout with motion may be made, to illustrate the idea

- 1 If the personality strip is not used on the front page it will find a good spot here (Fig 37) A 1-column strip of candid camera shots of people behind the news could extend from below the masthead to the bottom of the page, on the left Editorials could be blocked into the next 3 columns, to a point a third of the way below the fold, while a cartoon 3 columns in width, with overline centered, would take the upper right-hand corner of the page Such a page has diagonal movement from the lower left to the upper right, and this motion could be further accentuated by a couple of 1/2-column cuts or by a 1 column cut so placed as to emphasize this diagonal feeling. It will be further marked by a strong line of head type in 2 or 3 columns helow the editorials If the article used here carries a 16-col umn picture of the author, this cut should be in a diagonal line with cuts used in the editorials and with the cartoon, and it should be separated from the picture strip on the left by at least a ½ column of type matter help the diagonal feeling

  Any other heads on the page should the diagonal feeling

  The editorial block should be topped by a line of strong head type and should he given further appeal hy being printed in wide measure and in larger type be readily accomplished by dividing the 3-column space into 2 columns, with a 2 pica gutter and no column rule in the center and 2 picas of white space all around
- 2 Å 4-column channel can be marked off for the editonals down the center of the page from top to hottom (Fig 38). The masthead will occupy a shallow 2-column space on the left of this and letters from readers (or some other feature) a 2-column space on the upper right. A holdface 2-line head (say in 36 point) will top the editorial space, calling attention to the lead editorial,

Fig. 34.—British editorial pages are livelier than our own. Here, the London Daily Express used a boxed editorial and a photo of the Archbishop of Canterbury, in a layout with strong graphic appeal. which will be set in 12 or 14 point boldface, well leaded, across the whole 4 column space. Immediately below this lead editorial the cartoon will be placed, in little less than 4 columns in width, so that it may have 2 pieas of white space all around it Below the cartoon, the editorials will be continued in 2-column measure, with fair-sized heads, to the bottom of the page Below the masthead a 2 column news picture will be used creating diagonal feeling with the cartoon (one or two shallow 2-column reductions of horizontal newsphotos will also do in this position). In the lower right-hand corner of the page a 2 column secondary cartoon or a 2-column newsphoto completes the diagonal. An arrangement of 14-column cuts on the page further emphasizes the diagonal feeling.

- 3 A page with vertical or symmetric balance, yet with strong poster value uses a 4-column cartoon in the center of the page at the top, with an overline in strong head type (Fig. 39) Oa the left of it the masthead is set in 2 columns, shallow Below the masthead is a strong 2-hne bead on the lead editorial, which is set in double column measure 10 or 12 point boldface type leaded to a point 116 to 2 in below the fold, where it is squared Editorials are continued in 2-column measure belon the cartoon, and squared off in the 4-column space running longer than the lead editorial but leaving room for a 2-column secondary cartoon or a newsphoto in the center of the page at the hottom On the right of the page at the top, letters or some other feature occupy the 2-column space (but in 1-column measure), and are squared off on a line with the lead editorial. In the arm thus created on each side of the page a 1-column newsphoto is placed Heads and columns or features are dummied into the remaining spots
- 4 A 7-column editorial page (Fig 40) might be laid out with three 1-column personality shots on the left below the masthead a 3-column cartoon in the fourth, fifth, and sixth columns at the top, with centered overline, and a lead editorial in the second and third columns under a boldface head set 2-column measure, 12-point boldface. The remaining editorials are blocked off in 4 columns divided into 3 below, so that the cartoon seems to be mortised into the whole block of editorials. A 2-column ensyphoto in columns three and four just below the editorials and a 2-column cartoon in the lower right-hand corner complete.

If the KING Were to

DEFEAT WINTER ILLS WITH

the spotting of the page for balance with motion. The rest of the space on the page can be used for letters, feature columns, and other suitable matter

As we stated in the discussion of front-page makeup, any modernizing of editorial pages must also take into account a middle ground for reader clientele which is apt to resent overdisplay. The editorial page represents the intellectual personality of the newspaper. It should be as virile and approach able as are the best personalities of highly educated persons, but no attempt to avoid stodgy pedantry should result in an appearance which certain types of reader will mistake for demagoguery or lack of reasonable restraint. A well-informed man or woman possesses poise, even though dynamic, thoroughly practical, and moved by conviction.

If a newspaper is large enough to devote an entire page to editorial comment and the work of signed columnists with a cartoon, attractive balance which considers the whole page as a unit can be worked out in various ways. Many smaller papers, however, require that not more than balf the page be allotted to comment and masthead, the rest must contain early set news and perbaps one or two advertisements. One or two news pictures can effectively brighten an editorial page through strategic placing among its news columns.

In case pictures are used, it is well to select those which have editorial implication, preferably those which refer directly to editorials on the page. Almost any adequate mat or picture service or local photography staff makes this possible. The caption, by calling attention to the editorial involved, increaser interest in both the picture and the editorial and ties the news and editorial portions of the page together. For instance, a picture of Goebbels being toasted in beer by his comrades during the Nazi Jewish persecution should have a caption which refers by title to an editorial, not necessarily on the content of the picture, but on the Jewish persecutions, or on Goebbels' activities, etc.

A newspaper which devotes half its page to editorial comment, letters from the people, and reprinted editorial matter, may use this general principle of makeup

Masthead in the customary place in the upper left-hand corner of the page, 3 17-cm columns with type indented ½ cm on each

Fro. 36—A London tablond, the Daily Mirror, allustrates how facing editorial pages can be handled as an ensemble. The banner line reading across the fold is not to get out of alignment, as here, and is not recommended. has graphic interest, and the ads, in three groups, get attention. side, each editorial begun with a large initial letter which extends down 2 lines, body type set in 7 point on a 10-point slig, 3- or 4-line "pointed paragraphs" to insert between editorials or at the hottom of columns to break the columns up and assist in filling short gaps, since the hroader measure cannot he run over elsewhere on the page, a 3- or 4-column cartoon

Personal interview tests have revealed that the majority of readers look more often at the top of columns two and three than at column one. This probably is because the masthead kills the top of the left-hand column and because the eye normally moves right of the extreme left of any area or object, unless artificially pulled to the left by pictures or a large bead. Therefore, if a single column makeup is used, the two leading editorials may effectively be placed at the tops of columns two and three Either the first column helow the masthead can then be devoted to letters from the people, which have considerable departmentalized and feature interest, or the left-hand column can be devoted to several short editorials with a distinctly bumaninterest tone.

Whenever editorials are long, they may be squared off under 2-column heads and divided by broader dashes. If they run particularly long they may be broken up by asterisks, with the paragraph immediately following the asterisks beginning with a large initial. A few important paragraphs indented in lightface, or, if the paper has no policy against it, in boldface, will relieve long editorials.

A conservative daily newspaper in the Middle West uses 2-column heads entirely for editorials on 17-cm indented slugs in columns two and three. If the editorials are not long, this paper contains two editorials, one a little longer than the other, giving the 2 column head to the longer one, with the shorter editorial under a 1-column, 14-point boldface head forming the end of the squared-off matter.

Since the lower half of an editorial page, like the lower half of any other page, has been found to rate low in reader-attention value, the lower 3 or 4 in of the editorial columns may be devoted to candid shots of personalities of editorial significance, to maps or charts referred to in the editorials above, or to questions and answers under a 3-column boxed head. The boxed head over questions and answers may be used in this space only when

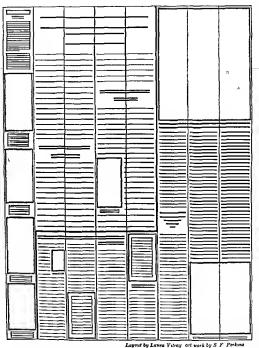

Fig. 37—American editorial pages can retain dignity yel look less forbidding. Many of them would gain by a more structural layout. Here the lead editorial is in 2-column measure with a rule accentuating the lay out pattern which is emphasized by the position of the secondary heads halftones, and boxed type. The large illustrations are cartoous

charts or pictures are not used. When pictures or charts are used, the questions and answers are used elsewhere on the page, sometimes under a reduced head.

The Columbia Missourian, a conservative middle-western small daily, published in a locality which has demonstrated an unusual interest in editorial comment, frequently uses either 17-em or 35½-em maps or charts slightly above the middle of an editorial referring to the map or chart. The Missourian's practice is to place this illustrated editorial helow the leading editorial is order to increase the graphic appeal of the secondary position. Some conservative papers avoid using any other illustration than a map, chart, or boxed table on the theory that a photograph would have to be too small in an editorial column to show and would lack dignity as an illustration for a relatively short comment, the major appeal of which is intellectual.

Another effective middle-ground editorial makeup is to create a 4 column rule box exteading down the middle of the editorial page to a point helow the fold which leaves just room eaough for a 4 column cartoon with its overline At the top of the rule hox is the masthead Below the masthead appear editorials in two equal broad-measure columns, indented a full em on each ead, set 1a 8-point type on a 10 point slug Editorial heads may be in 24 point, upper and lower case, centered over squared-off long editorials, or in 14 point centered over single-column, shorter editorials This makeup leaves two news measure columns on each side of the editorial panel. Lither editorial features or signed columns under boxed heads can be used for these narrowmeasure columns, or, if the paper requires straight news matter for these columns, regular news heads and at least two news pictures, directly or indirectly connected with the editorials, can he used, one on each side of the panel

Short, boxed editorials, 50 to 100 words, may he used to attract especial attention at the bottom of each 2 column news wing m such a panel makeup. In this case, they would come at each side of the cartoon hut would have less than half the depth of the cartoon. The type in them should be generously indented to give plenty of white space all around. If editorial matter, however, is placed in 17-em columns at the left hand side of the page, a 17-em boxed hine fedtorial may be effectively placed as a daily feature immediately under the masthead

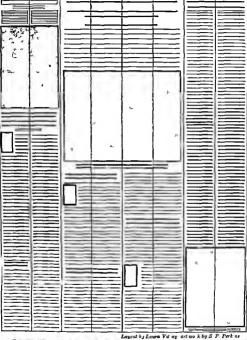

Fig. 38 -Newsphotos lend culor to the editional page and of course should be related to its content. Here the major ed toral holds the center of the page set in larger type with a 4-column lead above the 4-column cartoon and continued in 3-column measure below. The lower right illustration may be newsphoto or cartoon. Half-column cuts offer contrast to the larger att on the page.

Several variations will suggest themselves Principal aims to be achieved are 2-column beads over squared-off long editionals, large initial letters, asternsk breaks, at least 16½ or 17 cm measure well leaded, carefully broken makeup below the fold, pictures which refer to the editorials, and at least occasionally chart or map illustration run into the editorial matter

After readers have become accustomed to broad measure, 2-column heads, chart illustration, pictures, and ceater panel display, 10-point type for editorials may be used

#### THE OPP-ED PAGE

In laying out the editorial page the page which faces it, often called the "Opposite Editorial Page," should also be taken into careful consideration, in order to be sure that the two, when viewed as an ensemble, work well together (Figs 374, 384, 394, and 40A) Of course this facing page is sometimes sold for a full-page ad or most of the page is sold as a preferred advertising position, in which case it must be bandled as a regular inside page of the paper. On many newspapers it is reserved for editorial features, columns, and special commentary on the news, and advertising space, if any, is strictly limited. If the two pages are carefully laid out it is a good position for attention value and, it seems, should be a source of revenue to the paper. Three columns can be sold and still leavo room for good display of feature material.

Like the editorial page, this page need not be allowed to be gray in effect nor amorphous in pattern. Photos or cartoons can be used to give it layout with motion. A column of editorial comment can be set in double-column measure. The tinings to remember in dummying this page are. (1) Photographs and cartoons should be kept away from the advertising, (2) the elements that come together on the fold should show variety, that is, if single-column measure is used on one side of the fold, double-column on the other side offers contrast, type offers contrast with pictures, photo with cartoon, etc. Watch the fold to see that it offers this necessary contrast of material, shapes, and tone values (see Figs. 374, 384, and 394).

An Opp ed Picture Page When no advertising is sold on the opposite editorial page, it is possible to turn this into a picture page and still leave room for a column of editorial comment

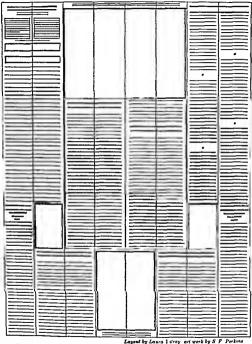

Fig. 39—Symmetric layout gives dignly to the editorial page. Here the chief editorial is in 2-column measure below a 4-column cartoon and is set off in a rule box from the rest of the page. An important editorial would also be carried in the first two columns under the meathest. Letter to the editor occupy columns 2 and 8 at the top. The two 1-column cuts are hallowers and the 2-column cut at the bottom is a secondary cartoon.

and an editorial feature (see Fig. 40A) This may take the place of the daily picture page or he supplementary to it

## TABLOID EDITORIAL AND OPP ED PAGES

Tabloid editorial and opposite editorial pages are of course simpler in design. The New York Daily News often gets good effect with a right-hand editorial page faced by a left-hand page of news pictures. The editorials are set in 10 point in 2-column measure on the left of the page, next to the fold. The center column on the page is a feature called "The Inquiring Photographer," sprinkled with five or six ½ column silhouetted faces of persous interviewed for their opinions on matters of interest. The upper right-hand corner of the page carries a 2 column curtoon, and below are letters to the editor. The editorials are broken by heads and indented for 2-line flush left subheads in 14 point holdface takes, giving a good impression of variety. The picture page carries a boxed picture feature, "The Correct Thing." On the whole, the treatment of the two pages is simple and dignified, yet illustrates what newsphotos will do for editorial disolar.

The Washington News (Scripps-Howard) uses editorials on the left hand page, in two double columns of 10 point on a 12-point slug, with centered 14-point italic cap heads in boldface A 3-column cartoon is set in the upper right corner on the fold and a feature called "Ask the News" fills out the fifth column Column rules have been dropped on this page and the page facing, which is devoted to several special columns, a cartoon, letters and editorial features. It uses sans-serif type in flush left heads and is spotted by several 1/2-column cuts Despite these modern innovations, the effect of the two pages is scattered and lacking in strong graphic appeal. The layout lacks the structural qualities which would make it forceful In Fig 41 a design is shown for placing this same material, omitting the column rules but using a heavy rule to emphasize structure, in a layout which has motion Bold display of the editorials can be obtained by placing them on both pages, using strong head type and wide measure leads in 12-point holdface across 4 columns, leaded A layout of this sort is shown in the illustrations, with newsphotos and cartoons tying the 2 page spread into a single layout (Fig 42)

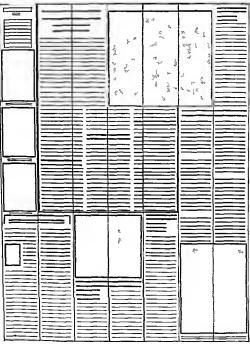

Fig. 40—Dramatis ag the editor als by effective layout guarantees them a better reading. Here the major ed for all starts with a ~column lead below which it is set 15 puras wide blocked off in three columns that fill out a 4-column space. A rule sets this editornal off from the others while the cartoon at the top appears as if mort sed into it. Other act on the page accentiates the asymmetric plan.

Any student or newspaper man dummying pages can work out a host of alternative layouts, combining the elements of the page to obtain graphic display. If uninteresting pages so often appear, it seems to he because the makeup editor only modifies details—improving typography, dropping column rules, etc—but never balf closes his eyes and momentarily views the page ensemble, not as type to be read, but as visual tone values to be effectively distributed.

#### A DAILY SPLIT PAGE

When a daily paper is printed in two sections, the first page of the second section, or "split page," has display potentialities secondary only to the front page. Many newspapers take advantage of this by giving the page very special treatment Often it carries no advertising and usually it carries the newspaper nameplate somewhat smaller than on Page One. Some papers use it as a local news page, others as a daily feature page, still others as a sports page. When the newspaper press has a third or "halloon" folder and so can turn the paper out in three sections, sports usually take the front page of the third and either local news or features the front page of the second section. There is something to he said for and against any one of these arrangements. Let us look them over critically.

Split Page of Local News If the front page of the newspaper is handled as a cover page, playing only one or two of the higgest stones of the day from far and wide, and using bulletins, blurbs and pictures to suggest to the reader that there is more big news inside, then the split page hecomes an excellent spot for local news stones, features, and photographs II, however, the principle of placing all big news on the front page is strictly adhered to, then important local stories will make the front page, only secondary ones the local page. Over a period of time the reader is apt to get the notion that this local page does not contain really important news. It loses its value for him.

The Feature Split Page There is undoubted appeal in a split page such as the World Telegram uses, containing one big feature story with illustration (part of a feature series carrying over from day to day) and a group of special columns. Yet the average newspaper would consider itself overburdened with columns and features if it had to devote this space to them in addition to an

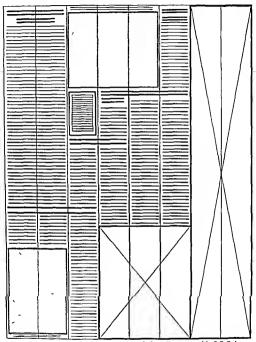

Fig. 37A —The opposite editorial page is regarded as a choice position by advertisers. The layout should create an ensemble with the editorial page. This page was designed to work with the one shown in Fig. 37.

opposite editorial page Of course if the columnists, or most of them, are placed here, the Opp-ed page could be made a picture page, as suggested above, possibly with the inclusion of one or more short articles of news comment Such an arrangement might prove very desirable and economical

Sports on the Split Page Sports news has high reader interest and sports pictures often have high dramatic values which can greatly enhance spht-page appeal, yet such a page will not have the pulling power for women it has for men are three sections, there is no doubt about sports taking the front page of one If there are only two, but the paper has several editions, it seems there might he a shift to give sports the front page of the second section on one edition Usually, even when sports begin on an inside page, this page carries the newspaper nameplate, so that the shift to front of the second section would involve no composing-room difficulties Certainly sports are not a particularly happy choice for this page in an edition intended for home delivery, whether of a morning or of an afternoon news paper, for, it has been shown, women constitute a large propor tion of all newspaper readers and the home edition is addressed especially to them

Cover Value of Split Page No matter what material is used on the split page, its value as a cover page should not be ignored Just as the front page of the paper should be handled in such a way as to entice the reader into the inside, so this page, which the reader often turns to hefore he has read any inside pages—by merely shuffling the two sections—must he given a treatment which helps to get the whole paper read One good way to do this is to headline and hlurh hig inside stories and features on the newspaper's front page, hut place the index to the whole paper, well displayed, on the split page, thus referring the reader backward and forward from this page to those containing advertising

Whether or not advertising is sold on the split page, newspictures should help to give it bold display. Here is a good place if local stories are used, for a layout of local action pictures, not just stodgy bust photographs or 1-column heads of local businessmen, but animated nictures from the local scene

A Circulation Builder The top of the page might profitably earry a local feature story with carry-over qualities, consisting of an interview each day with some interesting local business-

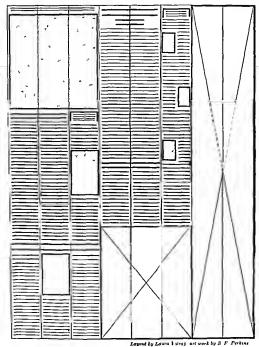

Fig. 38A—An Opp-ed page arranged to make an attractive gread with the page about for 38 This placing of 15-column cuts as often good beade an ad. With type indented for only one 52-column cut there may be inserted by placing one of them immediately below the other on the left of the column and the third on the right centered on the first two Such triangular groups of 15-column cuts may be used in serior.

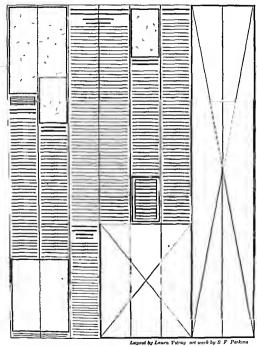

man, educator, housewife, boy or girl with a hobby, architect, traffic reform enthusast, visiting bigwig, city official, librarian, window dresser. Any imaginative editor can think of a limitless number of such stories, and very often they can have a direct tie-up with news, certainly with long range news. Almost any adult citizen in the community has feature possibilities. Planned in advance, such features give opportunity for a little better art work than is possible elsewhere in the paper.

A cameraman attached to the paper, or one of the local studios, if properly encouraged to do so, can get the "cutizen of the day" in a candid shot, with an interesting background suggestive of his or her netivities. This portrait study may be handled in a distinctive fashion with a special halftone screen that makes it look like a painting, with dropped-out whites and a charcoal screen, giving it the appearance of an artist's chircoal drawing, with a wash line around two sides to make it appear as if mounted on a block. The daily compliment to a reader will go a long way toward creating good will, at the same time that it provides split-page variety and interest, and the story accompanying it will give new color to the local news.

The newspaper nameplate may be moved to one corner of the split page, as was suggested for front-page layout, and such a portrait study can then be given a prominent spot in the upper right-hand corner Smaller cuts, ½ columns, 11 column, 1½ columns with ½-column cutlines, or 2 columns, will spot the page in a layout with motion, and the bottom of the page of course will be given pictorial or graphic interest too. The index, boxed or in full face, will serve as a spot in the page layout pet tern and thus gain attention.

Instead of a candid portrait study, such n local page may carry a news layout when there is an event that provides pictures. Possibilities of this sort should never be overlooked, whether the subject is a carnival, the drama of a fire or a storm, a cime story, or any other subject that can be treated pictorially. The news layout should always displace the feature, if this page is the one that carnes local spot news. The feature can then he moved to an inside local page, probably the second or third page in the same section.

Using Features and Columnists Sometimes a syndicated feature is used on the split page, together with several syndicated columns The World-Telegram's split page offers an interesting

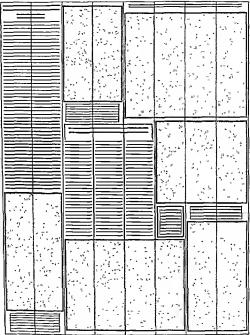

Fro 39A—The ads make it asymmetric yet the Opp-ed page will work well with the symmetric editorial page shown in Fig. 39. Such a page might carry editorial articles or new stores according to the needs and policy of the page:

arrangement of such material It has a panel of special columns down the left-hand side of the page, a feature holdly illustrated with drawings or photographs blocked into the upper right-hand part of the page to a point extending well helow the fold. This feature uses the 5 right hand columns, with a small hoxed column set in at the bottom of its space and with a 5-column comic strip helow it across the hottom of the page Half-column faces of the columnists help give the page an interesting spotting When the picture layout used with the feature is asymmetric in pattern the page takes on a very lively appearance, but when a single rectangular illustration or drawing is used, which in itself has no qualities of motion, it loses greatly in graphic appeal That is the greatest danger of an up and down division of the page It has no "swing" unless the pictures provide one On the other hand, the row of half columns down the left side make a nice balance for a large picture layout that has motion However, it seems that more cover value should be given the split page than the World-Telegram gives it Its page is a unit complete in itself, with no suggestion that there are other pages that might be worth a glance

Sports Page Is Lively Hardly anything can contribute so much liveliness and action to split page display as to use it for the front sports page Sports pictures lead themselves to daring croppings and bold layout patterns, and these, if properly handled, present no difficulties of makeup in the composing room

Many a sports picture of a star player in action can be blown up to a depth running well below the fold, in 2 column measure, with an arm outstretched across the page at the top, or in some such energetic cropping. A football player kicking the ball may be similarly blown up large, entirely silhouetted, and dummed into the page with columns squared off around it, leaving a certain amount of "air" or background. A silhouette used in this fashion dramatizes action powerfully. A page spotted with such a gruit action shot does not need, or want, any other art. The figure is run as deep as possible, and bottom-of-the-page interest is obtained by head type strong enough to provide a base for the layout. When the picture is not silhouetted, dropped-out whites will give it startling effectiveness.

The sports events may be of a nature which provides action pictures but nothing such as just described. An interesting by out uses a "movie stup" of a horse race or some event involved.

Layout by Laura Turay, art work by S F Perkins

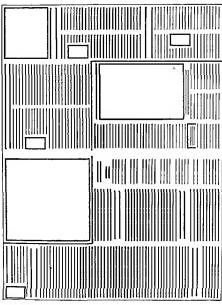

Fig. 40.4.—The picture page idea may be combined with editoral comment or news sories or special columns, for an Opp-ed page with graphic appeal. This was planned to work with the page shown in Fig. 40. The picture group carries its own 4-column overine at the top, as well as ample provision for underlines. ing progressive action, showing it at several stages — These will represent a careful selection to create the motion-picture illusion, rather than to give a long succession of shots too greatly resembling each other

Such a strip could hold the center of the page, in 1½-column measure centered in the 2-column space on an 8-column page running above and helow the fold, and with a large sports photo in the upper right-hand corner and another in the lower left hand, to create diagonal feeling. It could start in the upper right-hand corner, heside the nameplate, and he given a 2 or 3 column channel down to, or below, the fold. Smaller pictures would be used on the page to halance it

A horizontal movie strip of a single player in action can make a broad hand across the top of the page and will be more effective if unequally divided (see Chapter XIII on picture layouts) Such a strip will look well if other small cuts are placed for diagonal feeling on the page, though it may also form part of a symmetric page layout, with a tall 2-column cut centered at the bottom or the corners at the bottom spotted with 1, 1½ or 2 column cuts or blocked off with 2-column heads on stones each carrying a ½-column cut

Of course any arrangements described here or elsewhere in this book are meant only to be suggestive. Pictures themselves dictate the layout and to the alert editor will give many oppor tuaities for new and original treatments. The only rule to follow is to keep these bold, simple, and strong, rather than "fancy" and to see to it that they do not cause type to be set in odd measure on the page. Strict economy will often hold the picture editor down. But it seems that on the split page which has high attention value, he should be permitted a little leaves.

A first sports page should also have some cover attributes. It may hulletin sports stones that are on the inside pages, carry the index to the whole newspaper, or use one or more small pictures with cutlines referring to the inside sports news. Any of the layout suggestions that have been made apply as well to art for sports pages when this department is not given a splitpage position, except that of course it may not be thought advisable to spend money for too large or unusual cuts for the inside

## WOMAN'S PAGES OF THE DAILY

When there is a daily society page it usually carries local advertising and cannot attempt any but simple layouts. In some newspapers the woman's page and the society page face each other, and the advertising can be distributed over the two A few papers that make a particular feature of their woman's pages, with local shopping column, merchandising service, cooking articles, and other columns and articles that back up certain classes of advertising, may have two woman's pages and a society page as well. This is true only of some of the larger newspapers.

If there is a separate society page and advertising habitually runs strong on it, it may be well to carry alternative top-of-thepage cuts on the composing-room cut hank at all times If the 3 column cut fits better today, the 2 column will he left over and a new piece of art will be sent through in 3 columns to the engravers This simple device will avert many a difficult jam in making up the page Bottom-of the-page interest should be watched as in all inside pages and 1/2-column and 1-column cuts will do a lot for it Usually there is not an element of strict timeliness in society pictures, so that today's cut will still be good tomorrow, yet the greatest complaint against society page art is that it has no time element and no action. Here the rule laid down earlier in this book, that a picture must have at least two of the three values, personality, news, and action, should be more strictly adhered to, for it would strike out many of the "dead pan" cabinet photographs that take up room and add no attraction to society pages Cooperation, and even education, of local commercial photographers will do a lot toward raising the caliber of this kind of newspaper art Maybe the women need educating, too, and it might not be a had idea to offer prizes for the best amateur photos of society in action or for candid amateur portraits of matrons and debutantes in the community If these are not good enough copy to be enlarged, they can be combined to make an action strip A little newspaper initiative along this line can rapidly change the whole character of the pictures of society that flow in and can improve Sunday society pages as well as those of the daily Here is a problem that the newspaper picture editor should work out carefully with the society editor

p cture-page effect The left hand page carr es the photos the r ght hand page takes a 2-column lead on the rght-hand page Column This editorial hotos for a partual lead and drops into combines the edu torials columns nd eartoons with ow selected news while another am portant editorial column measure he eartoons and rules are not used g column cut the column at akes major

Layout by Latra Vitray art work by S F Perkins Woman's-page Art Woman's-page art usually includes a fashion picture. Often there is also a syndicated pattern illustrated by a small line drawing, a syndicated needlework feature with an illustration, and an interior decorating feature with a picture mat. The editor of the page may write a daily column that carries a 1½-column cut, and there may be a shopping column or a beauty column that carries a picture. Altogether, there is seldom any dearth of art for the woman's page, and the problem is sometimes to get it all in attractively

The fashion illustration is very apt to take the big play on the page, for two reasons Women are vitally interested in what is being worn, and the fashion picture, if properly used, helps get and hold advertising A wise fashion editor is in close contact with the local stores and sees to it that the pictures used on the page have a direct relation to what the stores are showing This has been made easier in recent years by the method of at least one news association, The Associated Press, which services fashion pictures with the names of shops in the newspaper's own com munity where the dresses, hats, shoes, gloves, accessories, or whatever it may be that is shown will he on sale Close coopera tion between the woman's page and the advertising department will help to hring ads into the paper on the days when these pictures are run Close cooperation is needed likewise hetween the picture editor and the woman's page. In many an office these pictures go to waste or are turned over to the right person so late that they have lost the value they could have When the picture situation on the paper is well handled, they will be used, but they will be supplemented by pictures taken by the newspaper cameraman or by a local photographer These shots can be arranged for with the heads of department stores and shops and will make use of merchandise about to go on sale The shop or the newspaper can usually find a pretty girl to pose in an evening gown or wear a pair of shoes while the photographer snaps her These fashion photographs in no case carry any reference to a store or to price, but they do go far toward creating advertiser good will and toward stimulating interest in new styles that are obtainable in the city

Fashion photographs often seem a little tame, and it is a problem how to play them, and how to dramatize the new styles. The wealthy metropolitan newspaper may prefer to send an artist out to sketch the styles, but with a limited hudget this is not always feasible. Most of the New York designers (and even the Pans conturners) will lend original drawings, to be used and returned, if the fashion editor will write and ask for them. However, these drawings will prove difficult to the up with local offerings and should only be resorted to as an occasional importation on the page.

Photographs must be watched for their style detail If the subject was improperly lighted, it may reveal nothing but general tone and outline, and, though this may make a soft and pleasing picture, it is not enough from the stylist's point of view Good lighting will hring out the buttons and tucks and shirring on the dress, the small trimming features on the hat, the pattern on the shoe leather or on the cloves or hag

Now and then a heauty picture will take the place of the fashion layout on the page This may be a photograph furnished by a syndicate, or it may be locally posed. Its purpose—and it must show plenty of detail, too—is to demonstrate how to apply mascara to the evelashes or rouge to the hps or cheeks, how to do the hair in the latest confiure, how to prune and paint the fingernails or toenails, or how to lift one's face with an egg mask or a night strap Though men may laugh, women look at such pictures, and they have an obvious relation to advertising When a heauty column is written by a woman on the paper. almost any subject she chooses can be illustrated at no expense out of Hollywood publicity pictures These usually come to the movie critic, not to the woman's page, but the picture editor will make a practice of going over them to take out shots that have lost timeliness for the movie columns but can be useful elsewhere in the paper These Hollywood pictures are always wonderful copy and contain many poses that illustrate beauty articles nicely

Of course there are free Hollywood fashion pictures too When they are simple, and can be tied up with local shop offerings, they may be used Even when they do not, an occasional one may lend glamour to a layout, but they should not be overdone Sometimes an arrangement can be made with local shopkepers to feature such things as a "Shirley Temple wardrobe," and the pictures can be obtained from the local publicity office or from Hollywood. A word of warning to the nicture

editor here it has happened that Hollywood fashion pictures have been copied and sold by free-lancers, but the well-informed picture editor does not fall into any such trap as this Good Hollywood fashion shots are often serviced by The Associated Press and other news picture agencies, and this is legitimate, when it comes as a part of the newspaper's regular service

Simple, striking hyouts with diagonal feeling, or single cuts used to create diagonal feeling on the page, are more effective that a great deal of fancy decoration on woman's pages. Crop fashion pictures to rectaogles or other simple geometric forms

Often it is typographically as well as pictorially that the woman's pages sin against good taste, the reason being that there is a desire to change pace from the rest of the paper. Simple head types remain better than amazing concoctions of hand lettering. If the newspaper is one that uses Bodom heads elsewhere, or one of the modern sans-serif types, a square-serif letter where, or one of the modern sans-serif types, a square-serif letter when the Karnak hightface may be chosen for special columns and for underlines in 10 point, Tempo a sans serif letter will make a contrast with Bodom, and Caslon will accord with Bodom incely Garamond may do well on certain woman's pages, though not too "modern" in its appeal

The point is choose your type and stick to it. If boxed heads are used, let them be simple rules, not curheues. Stay away from ornament. Let the page presentation be simple and strong. That advice has been repeated many times in this book, but some of the woman's pages need it most of all.

#### THE DAILY PICTURE PAGE

We discussed the mechanics of laying out a daily picture page in an earlier chapter. Some papers now use a mat service for their picture page, but local pictures have great appeal, too, and where facilities permit should be used along with those from distant places. When desired the mat may be cropped by drawing a line on the face of it to indicate to the stereotypers what part is to be left out. A picture may be removed from the mat in this way and a cut of a local newsphoto of the ideotical size inserted in the resulting hole in the flat cast. Picture pages reveal many examples of bad layout. Ofteo there is oo cohesion between unrelated shots, nearly of a size, used to fill the page

space Cutlines are small news stones and in regular body type lend the page an air of dullness

A good picture page carnes a banner line across the top or a dominant picture and a squared off heading in good sized type at the ton Cuthnes should tell their story briefly, with vigor and spritchness, even with humor if it is good humor, but they should avoid slanginess, cheapness, vulgarity What an apprentice caption writer imagines to be clever may not appeal to refined readers of the paper A good caption writer, like a good licadline writer, is a man of real value to his paper master of the terse, pithy phrase that puts the story over It is a good thing to study the eaption methods of Time magazine, if only to learn the secret of their brevity However, do not imitate them on a picture page. Here the picture and caption must tell the whole story, since they stand alone

Some papers put the first word or two of the eaption in larger type, or precede the caption with a sort of brief head or summary This may serve to eatch the reader's attention, but there should not be too great a difference between the size type used in this introductory phrase and the caption itself, or the little spots of dark type will draw the eye away from the pictures

Captions look better in a face that has sufficient strength Ordinary body type looks washed out on a page of dark halftones Use 10-point Caslon boldface, 12-point Garamond boldface, 10-point Stymic medium, 10-point Tempo medium, Bernhard Gothic medium, or some other type of your choice, but see that the type you choose has enough weight to match the tone of the newsphotos

#### A APPLICATION UNLECISES

- 1 Examine the editorial pages of three different daily newspapers Rate these pages for their attractiveness of layout Justify your rating specifically.
- 2 Show these three pages to five non journalistic adults without proj udicing comment Ask them to rate the pages for reader-enticing appear ance. Compare their indements with your own
- 3 Assume that your newspaper chentele consists largely of readers who prefer a dignified scholarly, yet lively and easy to-read editorial interpreta tion. On Bristol board or blank paper the size of the editorial page lay out a page which you think would appeal graphically to this clientele, using the ed torial page contents of the page which you ranked last in I xercise 1

- 4 Assume that your chentele consists largely of readers who prefer a sensitional coverage of big news, crime, and human interest stories Confining yourself to the news and feature material presented in any one copy of the three papers you used for Exercise 1, lay out on Bristol hoard or paper an editorial page layout for the next day's issue which you believe would best suit such a clientele, surgesting the topics you would handle editorially
- 5 On Bristol board or paper lay out an editorial page after the manner of any one of the four suggestions inducated in this chapter in the section entitled, "ideas for Spotting the Page," which you have not used for previous exercises. For this purpose, confine yourself to the contents of any one of the three editorial pages previously rated.
- 6 Select three woman's pages, three society pages, three sports pages, and three picture pages from three or more different daily newspapers. Rate the woman s pages, society, sports, and picture pages for graphic appeal Suggest at least one improvement for the poorest page in the group. Be prepared to justify in elass your ratings and suggestions for improvement.

### B CHAPTER ORGANIZING OUESTIONS

- 1 May the masthead of an editorial page he dispensed with? What bearing do you think the masthead, when placed at the top of a column, has upon the reader interest of an editorial immediately below it?
- 2 What do you think of the practice that some editorial pages follow of printing the name of the editor in the upper left corner of the editorial page, dropping the masthead to the lower left corner? What would you think of printing a ½-column cut of the publisher and of the chief editorial writer in the masthead;
- 3 What in your opinion are the relative ments of using 12 to 13 em columns for editorials or 17 to 193/2 em columns for editorials? Justify your answer.
- A If wider columns are used for editorial matter, what mechanical restrictions must be considered?
- 5 What are the advantages or disadvantages of dropping out column rules from an editorial page? If column rules are dropped, what also must be done for legibility?
- 6 What advantage is there to printing ½ column cuts of the authors of special columns, besides the advantage of spotting the page?
  - 7 How may the gray appearance of editorial columns be relieved?
- 8 In the editoral pages which you examined for the evereises in this dirighter, what proportion of the editorial topics discussed came from news of happenings or conditions within the trade area of the new-paper in which they were published?
- 9 What is meant by a hland column at the top of an editorial page, and why is its effect said to be weak? Is this charge of weakness true if the bland portion extends no more than 3 is from the top?
- 10 What specific advantage is there in using news photographs on an editoral page? Are there any disadvantages in certain types of news pictures on an editoral page?

- 11 Examine an editorial page from the New York Daily News What advantages and disadvantages can you see in running small cropped news photographs into the type of the editorials on this page?
- 12 What do you think of illustrating at least one editorial with 1½-col umn or 2-column charts or maps?
- 13 How may diagonal effect be gained with pictures on an editorial page?
- 14 Describe four methods of effectively apotting an editorial page
- 15 What restrictions must be put upon a newspaper front page if a split page is to be devoted daily to local news?
- 16 What specific advantages are there in the use of a split page for sports news?
  - 17 How may local pictures be used on a split page to build circulation?
    18 Explain both advantages and disadvantages in the World-Telegram's
- 18 Explain both advantages and disadvantages in the World-Telegram' use of split pages
- 19 What local the-up should be striven for in selecting pictures for the woman's page? What type face and sizes may be used effectively for special columns and underlines on woman's pages in newspapers which use Bodom heads elsewhere?
- 20 How may a locally written beauty column be effectively illustrated at no expense to the newspaper?
- 21 Explain ways in which society pages may be given liveliness without losing dignity or good taste
- 22 What objection is there to relying exclusively upon a mat service for a newspaper's picture page?
- 23 What care must be taken with the type used for picture page captions? Last five type faces and sizes which give satisfactory effects for picture-page captions.

#### CHAPTER XIX

## THE SUNDAY PAPER; LAYOUTS FOR LARGE-FORMAT AND TABLOID MAGAZINE PAGES

#### PREVIEW QUERIES

Did you devote as much as an hour to a Sunday newspaper on each of the last two Sundays? In how many different sections did you read as much as one column, other than the front page?

Did you read as many as three advertisements in each of these Sunday newspapers?

What, if any, sections of a Sunday newspaper do you seldom or never read? Why?

According to your general impression, are the Sunday papers with which you are familiar more attractive or less attractive than daily newspapers? Why?

Do weekly news reviews in the last Sunday paper that you read which contained them seem compellingly presented with respect to graphic appeal, or did you read them entirely because you are intrinsically interested in the contents of a news review?

Do you feel that there is more aimilarity between various Sunday newspapers than between daily newspapers?

Do you read the society section of any Sunday newspaper regularly? Is your general impression of this page one of sheer social news or gossip, or one of appropriate aliveness and well-bred glamour?

Have you read within the last two weeks as many as two articles or feature stories in a tabloid-format magazine supplement of a Sunday newspaper? Do the tabloid supplements of Sunday newspapers impress you as more or less interesting than the large-format sections of the Sunday paper?

RECENTLY some pertinent questions were put to the Sunday Reditor of a paper in a city of 125,000 inhabitants. The Sunday newspaper was the combined edition of a morning and afternoon paper, and there was no competitor in the field. Its sale extended over several counties Yet the Sunday circulation was only a third of the combined daily figures.

"What are your plans for getting and using pictures in the Sunday paper?" this editor was asked. He looked dumb-struck, then said: "I don't know what you mean. I've got nothing to do with that. I'm no photographer."

"But you do use photographs—in fact, the Sunday sections are crammed with them"

"Oh, sure Readers send 'em in, and we have to use them They get mad unless you do But we don't have to ask for any We just run them for circulation purposes"

As a circulation hulder, these photographs that "just had to he run" had not heen very successful They were wedged into the pages everywhere, wherever a spot could he made for one They were cahinet photographs of the dull, dreary, expression less variety Each separate picture may have pleased one reader temendously, but taken as a whole they could please no one Yet they occupied at least a third of the reading space Cropped in ovals, oblongs, and circles of all sizes, they produced an effect that made one's head swim

Needless to say, there are many Sunday editors who have a hetter conception of their joh than this one did, but there are also many who still do not realize the financial loss such art represents to the paper—loss in reader interest and therefore in circulation, loss in advertising, loss through heavy engraving costs that bring no return. An editor may think he cannot afford to omit such dull pictures, the truth is he cannot afford to run them

### SUNDAY PAPER OF THE FUTURE

Some publishers have wondered whether the Sunday paper was not a carry-over from the past, now "on its way out." They have argued that there are so many other things for the average family to do on Sunday, there is no longer any time for reading. The automobile, with radio attachment, takes them far from home, to listen to music while they grow acquainted with new scenes. In answer to this it might be pointed out that just as they take the radio along they will carry along the Sunday paper, if it has come to represent to the various members of the family real entertainment, a real opportunity to catch up with the news of the world, and real vistas of thought which, like Sunday's landscapes, may be culled over during the week to come

Publishers argued similarly that the Sunday rotogravure section was a hang over from the days when people could not see newsreels of events around the globe. They were about to pronounce the death sentence on these expensive picture supplements which failed to draw advertising when the appear-

ance of Life, followed by a whole galaxy of picture magazines proved to them that they had been wrong. The readers wanted pictures, and the advertisers crowded to this new medium, so eager to sign contracts that they could searcely be accommodated. It was just the newspaper presentation, old fashioned and unin spired, which had made the readers yawn. The fact that they failed to react to a poor spectacle did not mean they could not appreciate a good one.

Perhaps something of the same sort must be realized in regard to the Sunday paper. Too often it stands still. It must change for the hetter or die. Its editing must be energetie, and its presentation must he smart and modern, for readers do not react favorably to Victorian pages. They have eyes that have been trained by the motion-picture industry to appreciate exquisite visual images. A Sunday paper edited by an inexperienced amateur is about as appealing to them as the operatic screeching of an untufored vocalist, now that they can listen to superbinging by turning a button on the radio. The quality of the product must be improved.

#### WHAT IS A SUNDAY PAPER?

Contrary to uninformed notions the Sunday paper is not a dump for filler stories and for pictures which subscribers send in so that they may see their faces in the paper. Besides carrying the regular daily news, it is a well-organized, well rounded medium of entertainment and information for the entire family from the small hoy who wants it only for the "funnies" to mother who reads the woman's and society pages and the fash ions, grandmother who likes the fiction story, grandfather who follows a hobby for which he finds material in its pages, daughter who is musical, sister who is artistic. The adults may want to find in the paper a weekly summary of the news and articles of news commentary. Adulescents may prefer the latest glamorous details of Hollywood's movie stars. The Sunday paper is like a well stocked department store. It has something for everyone

The Sunday paper is a newspaper, too Not only in its first, or news, section, but in all its other sections, it has to do with news, and features of the news, with people who are in the news, with trends, modern ideas, arts, and foliles Its feature sections reflect the life and thought of Americans today and of other

nations around the globe Because what it offers has the peculiar quality of timeliness, it makes abundant use of photography to tell its many-sided story

The Sunday paper is an indvertising medium. Its bulk is dependent, not entirely on what readers wint, but on the amount of advertising that must be balanced by reading matter. This advertising is in itself "good reading" to many people, particularly to women. The situation might almost be summed up by asying that "pages which attract readers will attract advertising and pages which attract advertising will attract more readers." Obviously there is every reason for giving Sunday pages the maximum of reading microst and of graphic angeal.

### THE SUNDAY SECTIONS.

The material, then, for the Sundry paper, is widely diversified and must be gathered into sections with as much logic and good minagement as possible Before considering the Sunday picture problem in detail, it might be well to east a glance at the general line-up of sections. These vary greatly with individual newspapers, but nimost any newspaper will show some sections from the following list.

- 1 Regular news section, similar to the daily
- 2 Sports section This may be combined with the news section
- 3 Special articles section, containing articles on polities and foreign affairs, a news review, science articles, editorials, book reviews
- 4 Society and woman's section News of society events, women a clubs and the fraternal organizations. It may also contain women's feature pages such as fasluon, interior decorating, cooking, beauty.
- 5 Large format feature section Some or all of the pages may be bought in mat form from syndicates and may include any or all of such subjects as fiction, news features, Hollywood features women's features
- 6 Tabloid magazine Similar in content to the large format feature section Many newspapers now buy a complete tabloid section published in rotogravure, a few print their own
- 7. Theater section Review and comment on stage, screen, radio, att and music, and the dance It may be turned into a general entertainment section to take the place of the popular feature section and can include page spreads on Hollywood and radio stars and such departments as 'hobbies, bridge, etc

- 8 Travel section or school section These may be combined in a single section using the front page for travel in the warm months, and for schools in the winter, or a travel section may appear semiannually, if there is sufficient advertising
- 9 Books Book advertising supports such a section only on a few of the largest papers See special articles section above
- 10 Real estate Such a section is largely controlled by the advertising department
- 11 Financial Only the largest papers would have a separate section Financial pages may be included in another part of the paper, such as real estate.
- 12 Children's feature section Many newspapers buy a tabloid section complete for children
- 13 Comics
- 14 Rotogravure section Really a Sunday picture magazine in large or tabloid format.

From this list of possible sections it is evident that the Sunday line-up is flexible, that pages which appear in one section in one paper may be found elsewhere in another, that material may either be developed on the newspaper or purchased in the form of page mats or clip sheets and art or else as a completely printed section which is stuffed into the Sunday paper by the mailers

The picture editor should have a clear idea of what is developed on his paper, and by whom, and of what is purchased on the out side and in what form. Then he will be able to organize his job so as to lend the greatest possible assistance to the Sunday editor and to department heads who develop material for the Sunday paper. The Sunday editor also needs to have the whole situation in mind, so is to plan a well rounded paper, assist department heads to get interesting stories and attractive art and layouts for Sunday pages, and accord purchased material with the general style of the paper in so far as possible

## VARIETY IN FRONT-PAGE LAYOUTS

The Sunday sections need variety of presentation They must be planned so they do not all look alike This is not difficult, if each aims at reflecting the type of material it contains Variety will be obtained by layout and by typography Of course the main news section will be handled as on other days The remainder of the Sunday sections will remain in keeping with the general character of the paper, but each will show a char

acteristic style of presentation which distinguishes it to the reader's eye. Thus, the special articles section may use symmetric layout on its front page, suggesting dignity, while a popular feature section may be strongly asymmetric, a society front page may crop its high candid shots of social events in interesting geometric forms, while a tabloid feature section uses layout with pattern. A theater section may regularly employ special screens or stipples or dropped-out whites to dramatize its front page neutures of the stars.

The newspaper's regular headline style will be more or less closely adhered to throughout the Sunday paper, but some sections may use the boldface of the head type, others the light-face, for the sake of variety. A popular feature section may ahandon headline style for hand lettering or for other faces which reflect the light character of the material.

Only by careful planning can the foundation he laid for an attractive and diversified Sunday line-up of sections that appeal to the reader's eye and that do not repel him by their monotonous appearance

## ART FOR SUNDAY PAGES

When general plans have been worked out, the next step is to develop an organization and system for bringing into the Sunday paper a regular stream of pictures with which dynamic page layouts can be hudt. This is a task which will require all the resourcefulness and inventive genius of Sunday editor and picture editor. It may mean reeducating the commercial photographers in the community and the readers themselves. It will often mean changing the ideas of department heads who have been used to preparing pages in the easiest way week after week, year after year and who are resistant to progress. It will always mean looking alead and charting possible neture needs.

## SPECIAL ARTICLES SECTION

Many pictures for this section will be drawn from those which have been flowing into the office all week, from newsphoto services and from staff photographers. Those which were good copy, and timely, but which were not used in the daily, may be the very ones required to make stirking Sunday layouts. Even those which were used in the daily can be given a different treat-

ment Enlarged or reduced, with a change of cropping and a new layout, they will seem fresh to the reader's eye

The picture editor should keep Sunday requirements in mind as he goes through the pictures each day, the Sunday editor should make it a habit to glance through all pictures after the news room has made its selections and before they are sent to the morgue to be filed He can retain any he thinks may fit articles he has scheduled Others he will find in the morgue He may have a long-range discussion of the labor movement and will draw on the morgue files for pictures that go back over a period of several years A political article may get a layout of candid shots of the men it mentions, all drawn from the files A good collection of foreign news pictures will be drawn on for Sunday pages continuously If these morgue files seem weak in any particular direction, the picture editor should assume the responsi hility for getting new pictures to build them up is planned early, there will be time to see what pictures are lacking and to query the regular services, the commercial picture agencies and other newsphoto sources

The special articles section is close on the heels of the msin news in its use of newsphotos, but it should handle them differently. News pages frequently used single cuts or simple picture groups. Sunday pages can go into the more important pastedowns, photomontages, and other dramatic forms. Drawings and cartoons will combine with the halftones effectively. Cartoons may be had for the trouble of clipping them from out-of town papers, gumming them down on Bristol board, and giving them to the engraver to reproduce as line cuts. Two or more may often be worked into a layout, of course with credit to the newspapers where they originated.

Makeup for Special Articles II symmetric makeup is used in this section, the type will probably be put in according to what is known as "wrap-around" style. The principal story takes a banner across the top of the page and is run full to the bottom of the page in the first and eighth columns, but is held shallow across the upper portion of the other 6 columns, to leave room for a 6-column head near the fold. This secondary story similarly wraps around one with a 4-column head lower down. The principal layout is on the lead story, but the second story may also take a picture under its head, or the page may have

matching cuts in the two lower corners, either on the lead or on the secondary story. This general scheme is often modified by using two stories, one on each side of the page at the top with a layout separating them. A hanner line may read into one of them and he ruled off from the other

Symmetric makeup may he used for some pages and ahandoned on others for contrast, using an asymmetric picture layout Sometimes the front page may be given an asymmetric treatment with a special feature spotted by placing it in a hox with a heavier rule around it, after the manner of a small page superimposed on a large one

# WEEKLY REVIEW OF THE NEWS

In this, as in many other things, the newspaper has heen taking lessons from the magazine field. The popularity of Time proved that there was a market for something in the nature of a resume of important events the world around, if written in spritely style and neatly presented. Prohably what news papers have overlooked was that presentation had much to do with Time's success, both from the writing and from the visual standpoint. Time's reading matter is expertly seasoned, and its pages look entertaining. Its pictures are small hut well chosen and its cuttines epigrammatic.

The newspaper seeking to capitalize on the vogue for news reviews which Time inaugurated should see to it that everything about such a page or pages is the reverse of stuffy. Since the printing and distribution of the Sunday paper locally can be accomplished with much greater speed than can the national distribution of a magazine, it is always easy to keep this feature more up-to-the-minute than the news magazine can be. In spite of that, such pages are often so dull and unattractive in appearance that they probably are buttle read.

The New York Times employs for the most part a large picture layout across the top of the news review, thus giving it an appearance similar to other Sunday pages, and a page hottom that is decidedly gray Since many stones are hirefly handled on the page, it seems that a better plan would he to resort to a special form of layout and picture treatment, one that is frankly remnins cent of Time. This can be done by using an assortment of newsphotos relating to the stones covered. These photos are reduced.

to a half or even a quarter of the size in which they would be reproduced for the daily Thus a scene involving a group, which would be made up in 3 or 4 columns for the daily, becomes a 2 column cut For good results only photos which are excellent copy for reproduction will be selected for the news review

A national news layout of these extra-small pictures can be spread across the top of the page, a secondary layout of foreign news can he used near the fold and the lower corners of the page may take hvely little pictures of people who have been head liners during the week in other departments of the news. A 2 column box of boldface hulletins, 2 or 3 lines each, giving the biggest stories at a flash, last-moute hulletins, or quotations of pithy remarks culled from the week's news, will further lend to the appearance of the page. Symmetric makeup will probably look hest, particularly if this is the front page of the section It should carry a hanner and he well broken up typographically with heads for departments and for stories, with subheads, full face paragraphs, hoxes hulletins, and any other device which can serve to make it interesting to the eye

To he acceptable for the news review, photos should he candid shots or have action and animation. Nothing dull should ever find its place here, and newsphotos that can only tell their story if enlarged to make an important spread on the page would be hetter reserved for articles of news comment.

### SOCIETY AND WOMAN'S SECTION

Sunday society pages throughout the country probably show the dullest pictures and layouts, the reason being that studio portraits are used which lack animation and that stiff traditional page arrangements are followed year in and year out. Who is not familiar with the ovals and oblongs of the front page of society? There is a twofold job to be accomplished here, one that challenges the imagination of picture editor, Sunday editor, and society editor. Good action photos of parties and social events would bring the Sunday society section to life. The women themselves can be encouraged to hring in such pictures and so can the local commercial studies. It may be necessary to "start the vogue" for action shots of the gay side of community life, and perhaps a promotion job will have to be done for the idea, but it is worth it. The society section should be glamorous

In the springtime, women can be photographed in their gardens, motoring, at lawn parties, with their children or pets in outdoor surroundings. In the winter, at their bridge parties, dances, dinners. When none of these photos with hackground can be obtained, at least insist that the commercial photographer strive for animation—the candid quality—in his pictures, if he wants to see his credit hie in the Sunday paper. Such pictures, once obtained, should be worked into striking lifyouts. The more animated they are, the less they will fit into the old forms Layout with pattern, as opposed to merely asymmetric layout can nowhere he better employed than on front-page society Properly handled, the section can rival the Sunday roto as a lively, fascinating picture magazine of the whole life of the community—a far cry from what it is today.

News of the women's clubs and fraternities, which will probably be included in this part of the Sunday paper, needs the same sort of animated treatment. As a matter of fact, club nictures can be secured long in advance and used from time to time as there is call for them, making this type of page easy to illustrate The picture editor should keep a list of all the women's clubs and fraternal organizations in the community, with the meeting place and time indicated By working on this list he can gradually build up a small collection of good shots taken at the meetings. He may have to call the club presidents on the telephone and talk things over with them, suggesting what sort of pictures the paper would like to have in its files and perhaps leaving it up to the club to call in a photographer and arrange an animated group shot He may be able to assign a staff camera man occasionally to one of these meetings to get five or six different group shots for the picture morgue, then it will be possible to draw on these for Sunday pages, rather than on the dull calumet photos sent un by members

Syndicated mats are often used for interior decorating and cooking articles, though here again are subjects which lead themselves to good illustration in the local field, if the newspaper cares to do the work. In any case the picture editor should insist on good illustration. Interior decorating shots in particular are apt to show bad retouching visible in clearly defined lines around the outlines of furniture etc. which greatly mar the effect. When pictures are furnished by syndicates they are

sometimes not from the original negative but are very dull copies of an original print

#### POPULAR FEATURE SECTION IN LARGE FORMAT

Originality, gaiety, spritchness, holdness of presentation are all desirable in a popular feature section, but the trained eye comes to distinguish hetween boldly effective and original display and tawdry hodgepodge of pictures scattered over the page When the newspaper buys its pages complete, in mat form or as a printed supplement which is merely added to the Sunday paper, it is more or less ohliged to use what it gets. However, it would not get so poor a product as it sometimes does but for the fact that there is much loose thinking about what constitutes an effective feature page.

Advertisers are smart enough to know that defying the laws of graphic display does not reap them a rich reward, that a jumbled and disorderly layout using a dozen different type faces and an assortment of drawings and photographs in odd sizes and shapes is repellent rather than attractive to the reader. They know how to get attention value for their ad hy strong but simple graphic design. There is still a myth among newspaper people that the more hornfyingly had the treatment of a feature page the more "popular" it will seem. The idea is the reverse of common sense. Readers do read such pages for their popular feature content, but they do not react to them as layout could make them do.

We are streamlining so many things about the newspaper, it is time to streamline these popular features. To that end the photos used and the drawings as well should be made to conform to simple geometric patterns, combined with bold asymmetric handling. The amorphous layouts of drawings intermingling with large and small photographs (some the size of postage stamps), which we so often see, should be relegated to a museum of ancient oddities. They belong to an era of amateurism in newspaper page layout, and they do not correspond to modern tastes at all. As a matter of fact, change is being forced upon these feature sections. Once again the influence comes from the magazine field, where modern layout is beginning to mold popular tastes and create a reader reaction in favor of the graphic arts.

and directness of visual appeal—these are the elements which should help to make the feature page of the future. The newspaper which originates its own Sunday feature pages can work to this end, and it can make its voice heard with the national syndicates from which it huys features.

Feature page Mais Often full page mats of Hollywood and radio and other popular features are purchased for the Sunday When these do not meet style requirements they may frequently be changed and improved at little expense The chief faults of such page mats are bad hand lettering hadly arranged layouts, page width which does not correspond to that of the newspaper To remedy these defects, give the mat to the stereotypers with instructions to make separate flat casts of the art and of the type portions of the page They will saw these apart in the cast, will separate parts of the picture layout where this seems feasible, and will mortise out the head so that a new one may be set or hand lettered and fitted into the space times it is possible to get the pictures in several units and redis tribute them on the page for better effect. It may be necessary to reset the type If the mat is too narrow, the art can usually he spread, and the type either used and an extra column of filler added or the page reset. Even if resetting is done on such a page it hy no means involves the expense there would have heen in developing the feature in the first place. The story itself in most cases would have cost considerably more than the mat. and there would also have been engraving costs

The editor should never cut the page mat but should mark it with lines indicating how he wishes it divided or should hand it to the boss stereotyper, foreman of the composing room, or mechanical superintendent, with an explanation of what is to be done. The stereotypers will often make two flat casts of the page so that they may more readily not up the metal to committee north desired.

### THE SUNDAY TABLOID MAGAZINE

Many newspapers are now including in their Sunday paper a national syndicated tabloid magazine of features and fiction. A few, like the New York Times and the New York Daily News, are producing a tabloid magazine section of their own which is outstanding in its field. Most of these magazines are published in rotogravure and make wide use of color. There is no more striking evidence of the technical advances that have been made in recent years than the perfect legibility of their text type. It used to be considered impossible for roto reproduction to maintain the perfect clarity of the hold vive, but that entiesm has been removed.

The tabloid magazine is a good place for layout with pattern A daily tabloid must stock to simple picture forms and usually to separate cuts, but the Sunday magazine in tabloid form has a chance to be strongly original. It can get motion into its pages with arcs and diagonal hands, with halance of large and small shapes. It can use three-dimensional forms effectively. Its layouts should use every means to attain dramatic results with modern feeling. In this respect the New York Times Magazine offers an excellent example of dramatization without loss of dignity.

Layouts are still to be found in the tabloid magazines which, despite the splendid reproduction processes they command, the use of color, and even full color work, look decidedly out-of-date The reason may sometimes he found in the choice of subject Sentimentality is excessive, reader content too low, and layout often lacks the "streamline" quality, proving that picture editor and art department do not consistently keep step with the progress of engraver and technician.

## THEATER AND MOVIE SECTION

An abundance of excellent art is always available for the theater and movie section. Publicity photos sent out by Hollywood producers are among the best from the reproduction standpoint the newspaper receives and often lend themselves to striking treatment. They should be used large enough to have dramatic values and not in crazy quit arrangements. The front page may employ either symmetric or asymmetric layout. Dropped-out whites and special screens and art and engraving techniques will help to give the section an individual appearance.

If an art page is used in this section, it will be a good spot for a weekly column on amateur photography, edited by one of the newspaper's cameramen Amateur shots submitted by readers can be used on the page and in other parts of the Sunday paper Stirring up interest in the art of photography and the graphic

arts in general is a good way to start a stream of really fine pictures flowing into the paper Local art exhibitions will provide illustrations, and others may be obtained by writing to art museums throughout the country where special exhibitions are heing held which deserve mention in the Sunday columns Local artists will occasionally make good feature stories. The public library's picture collection may be worth exploiting, and new hooks on art subjects can form the basis of articles and pictures.

Articles on music will often feature pictures of visiting celeh rities, but they should not overlook the picture possibilities of local groups, school orchestras, and festivals which can lend color and action to the page Local interest can also be injected into pictures used for syndicated bridge columns, hobby articles, etc.

#### TRAVEL AND SCHOOLS

Many pictures used for a travel and resort section are neces sarily of a publicity nature, yet a little effort of imagination will often lift the front-page layout out of the ordinary. One might, for instance, pick out all the interesting destinations within the radius of a week end auto trip and spot the photos as halftones on a large map reproduced in line occupying most of the page Historic pictures of famous resorts might he used in contrast with present-day scenes. Staff members leaving on vacations might he asked to bring back pictures taken along their route, which might very possibly furnish an interesting Sunday page. The ingenious editor will find ways to keep the page from looking the same, week after week. People develop a hlind spot for the too familiar and must be startled into fresh seeing. Usually travel ads are striking enough, and so inside travel pages require less attention.

As previously noted, it may be a good idea to have a section devoted to travel and resorts during the vacation months, to schools during the winter. On papers which cannot support such a section regularly, it may be possible to have a semiannual travel section.

For a school page any community offers a wealth of interesting material Nature study classes, woodworking classes athletic activities, and dramatics, all are interesting subjects for photog raphy School principals will almost always cooperate, if a cameraman from the newspaper is occasionally assigned to cover educational activities Such pictures are circulation builders, for they please many families

## OTHER SECTIONS

Perhaps not much can he done by a picture editor to improve such sections as real estate or the financial pages of the Sunday paper, yet he should keep his eye on them and he ready to offer occasional suggestions. Too often the illustrations in the editorial columns of real estate exactly duplicate those in the advertisements alongside them. A hetter job could he done by the advertising department, which handles this, if it arranged to pose a pretty girl in the Litchen of the model home or in some other fashion thought human interest and action into the nhotos used.

A children's section is usually hought ready-made if used at all The hest known section of this sort is a tahloid following regular tahloid news page makeup, with stories and illustrations adapted to children

In summary, it might he said of the Sunday paper that it uses more dramatic layoutathan the daily wherever possible problem of the Sunday is to substitute action pictures for dull, stereotyped illustration. This can hest be done by intensive study and cultivation of the hest sources for nictures.

## A APPLICATION EXERCISES

al Procure a copy of what you regard as the best Sunday newspaper on set in your community. Examine the front page Confining yourself to news in this paper, write a description of a picture layout which you believe would improve the reader interest of the front page and at the same time induce you to turn to insufe pages or sections.

2 Turn through the pages of this Sunday paper Rate each different section of the paper for its comparative reader interest with respect to the graphic makeup, including news photographs, of (1) front page of each

section, (2) the inside pages of each section

3 Take the editorial or special articles section of the copy which you procured for Exercise 1 Confining yourself to the contents of this section, also unto in Bristol board or large blank paper a new first page for this section which you believe accomplishes two ends a more attractive, yet appropriately digmifted graphic appearance calculated to induce a reader to stop and read that section as he thumbs through the several sections of

the entire newspaper, an inducement on this first page to read inside pages of this section, perhaps inside pages of other sections

- 4 Turn to the weekly review of the news part of this Sunday paper, if it has one, if it does not have such a department, examine such a feature in some other Sunday paper. On Bristol board or blank paper, lay out a domestic-news review and a foreign news review indicating how you would give appropriate graphue appeal and prevent a dull effect.
- 5 on Bristol board or blank paper lay out an effective society page, confining yourself to the content of the society page of the paper selected for Exercise I, but indicating some different pictures, if you think it advisable Try to get an appropriate glamour Indicate pictures which it would be maticable to secure, however.

#### B CHAPTER-ORGANIZING QUESTIONS

- 1 By asking five adult non-journalistic acquaintances specific, objective questions, try to discover whether these persons devote more or less time to Sunday-paper reading than to daily paper reading. What sections of their Sunday papers do they skip entirely or find least interesting? Try to discover whether they find the syndicated material in Sunday papers more interesting to them than the spot news or locally prepared interpretation. Try to discover how effective they find photo presentation in Sunday papers, compared with the photographic presentation of daily papers. Be prepared to discuss your findings in class.
- 2 At a recent national publishers' meeting, the charge was made that nationally syndicated material, because of its economy, bad excluded much local material which increased size of a Sunday paper would accommodate, thus deadening the paper for readers and injuring it as an advertising Incidium. Using the paper procured for Exercise 1, support or rebut thus argument.
- 3 Can a Sunday editor afford to leave out photographs sent in by his readers? Justify your answer
- 4 What did picture magazines prove to newspaper publishers who had concluded that the Sunday rotogravure section had been displaced by newsreels? What predominant element must the Sunday paper contain other than a spacious repository for long feature articles and syndicated material?
- 5 What commercial value is there in a children's section other than the appeal to parents to buy a paper which their children will find interesting? What besides making the best use of routine pictures should the Sunday and picture editors do to improve the photographic content of the Sunday paper?
- 6 From what two places in the newspaper office may pictures be obtained for a Sunday special article on the labor movement?
  - 7 How may cartoons from other newspapers be used in the Sunday paper?
  - 8 Explain what is meant by a "wrap-around" makeup
- 9 What about Time magazine's presentation hesides departmentalizing and the news review idea must not be overlooked in the news review portions

of the Sunday paper, if Time magazine's popularity is to be expected for this section of the Sunday paper?

section of the Sunday paper?

10 Explain the specific ways in which the news review can be livened up

11 List three principal faults with Sunday society pages as a whole List three types of picture contents which can be used on Sunday society pages to replace studio portraits

12 What plan may be used to build up interesting pictures of women's clubs and fraternal organizations in the community?

13 How may syndicated pictures for interior decorating and cooking articles be effectively localized?

14 Explain the makeup errors often seen in Sunday feature pages which, however, use a good many pictures

15 What basic principle should be observed in making Sunday feature

pages attractive?

16 Last the chief faults of full page mats for popular features Explain

what can be done to improve these at minimum cost

17 Why should an editor never cut a page mat up with a pair of shears?

18 What strong reader-interest appeals are often found in the tabloid Sunday magazine? What outstanding faults?

#### CHAPTER XX

# ROTOGRAVURE LAYOUT, CHOICE OF SUBJECTS, INTAGLIO PROCESS, ROTO PRINTING

#### PREVIEW OUERIES

What journalistic "dying horse" got on its feet and won a newspaper ' steeplechase"?

What change in the content of rotogravure pictures was made necessary by newsreels and high speed pictorial reporting in daily papers?

What did picture magazines prove to publishers about rotogravure sections?

What does the "roto" part of the term rotogravure signify which helps distinguish the rotogravure process from the halftone process? Why are pictures for rotogravure never pasted down as they often

are for halftone layouts?

How may type captions be given hackground so as not to detract with flattening white space from the unified effect of a rotogravura page? By what simple device may a three-dimensional effect be obtained

for page headings without the use of dimensional type faces? How do the inked surfaces of a rotogravure cylinder sharply differ

from the inked surfaces of a balftone plate?

What invention has made it possible within the last few years to print rotogravures in four colors at high speed?

What is the "doctor hlade' in the rotogravure process?

I there is any subject connected with the Sunday paper which justifies tense enthusiasm today, it is that of the rotogravure Like a dving horse that got up and won a steeplechase, this pictorial supplement, after leading many to believe it had outlived its usefulness, has magically been revivified and may yet turn out to be the most potent factor of all in selling Sunday papers Its story is an object lesson in what shortsightedness can do to kill a really good thing and how far a little constructive imagination may succeed in injecting life into it

Roto got its start in the days when there was little or no pictorial reporting in daily new spapers, for the reason that halftone reproduction was slow and costly and technically not good enough to he attractive on ordinary newsprint News photography at its inception was not producing the vast news coverage of today, wirephoto had not made its appearance, and the pictures con nected with a major event occurring at a great distance were perhaps not received until weeks afterward Under these circumstances they no longer had the timelioess the daily required but they could be gathered together in the Sunday roto section where, on hetter paper stock and with the better results which could be attained with intagho etching and printing, they con stituted a valuable Sunday feature

Introduction of high speed in pictorial reporting and the achievement of speed and quality in newspaper halftone rohhed the roto sections of the newsphotos which had been their raw material The cream of these went into the daily, and the adver tisers followed them in deserting a section which no longer had any distinctive reader appeal Rotos for a number of years until recently, were the dumping ground for newsphoto leftorers, stunt pictures, publicity pictures, and "leg" pictures of beautiful girls Bathing suits, bahies, and baskets of kittens reoccurred with horing frequency The fact was that nobody any longer knew what the roto section could or should contain, and so what ever pictures belonged nowhere else were regarded as its rightful meat Even the syndicates adopted this simple rule, servicing large numbers of meaningless specimens of nice photography as "roto pictures" A good thing, too, will always do with simple presentation, whereas a product without intrinsic interest usually gets some dressing up to try to make it acceptable Soroto layout reached the high point of fantasy From the publisher's stand point, it was a dead weight of investment without returns, and many foresaw that it would cease to exist

Theo something happened A few far seeing editors perceived that the roto still had immense possibilities, even though not as a medium of straight news photography All it needed was a selection of material which corresponded to actual interests—in other words, intelligent editing. The birth of the news magazines, their overwhelming popularity, and their success in drawing national advertising left no doubt in anyone's mind concerning rotogravure's future Today we are witnessing a nation-wide rejuvenation of the rote, with experimentation in format, in picture selection, and in technical problems

#### WHAT IS THE ROTO?

Because the roto can no longer command the cream of the spot news pictures is no reason to suppose that it is a section without timeliness. If that were true it would have no place in a newspaper at all. The roto is concerned with news on a broader hase than spot news with the whole life of our contemporary world. Where and why and how things are happening today—that is the story the roto has to tell, a story that every reader finds intensely interesting.

Roto pages are not directed to the eye alone, hut to the mind, which desires to realize life more fulls and adequately, and which can do so through pictures. Picture pages are engrossing, not because they contain a wild assortment of disconnected photographs of hon cubs and prize fighters and movie stars and ski jumpers, but hecause they give us something to think about, through their connected presentation of some phase of the modern world. The pictures which go into the roto section should be pictorial features of the news, either the immediate news or long range always or that news which is inherent in the everyday life and activatics of people of today, everywhere

A Suaday feature story has a theme, or lead It is not just a jumble of fine plinases, but it is written to tell about something It may he an article on the trend of forcing dictatorships, or it may be an article on the town children and their vegetable gardens. In any case, it presents an orderly set of ideas and unages, and that is precisely what the roto feature must do

Since we are taking a page from the picture magazines in building the new rotogravure section, it seems worth while to quote here a recent advertisement of Life, in which that magazine sets forth its purpose and aims. Its picture creed is onewhich every roto editor might well adopt. It reads

# Pictures-the New Responsibility

Photographs, the great realists, can distort the truth by a wanton emphasis on the evil the cruel the sensational of life

Life reports the news as it occurs, Life can not "protect" its readers from the shuddering truth about war and disaster But Life shows other truth, the quieter truth from which the news headline violently erupts

Life s mind guided cameras have gone forth across the vast face of America and pictured its normal, pleasant expressions—its college life and small town folkways its wheat ripening in the sun, and its research proceeding patiently in busy laboratories

Out of Life's resolve to make pictures responsible—as well as powerful

—Life's editors have made a tremendous discovery that millions of
people can he as deeply interested in pictures of calm daily life as in
pictures of the accidental, the sudden, the explosive which makes the
news

By showing these simple stories side by side with its aews picture stories, by maintaining the good balance between the extraordinary and the ordinary. Lefe meets its obligation to show—not any one aspect of life—but life

Roto then is news, but not spot news It may follow the head lines, devoting a page or a part of a page to a side light or sum mary of an event of the week, or it may depart from the headlines altogether, seeking out all the human interest themes and the mitters demanding evplanation and illumination in the local or the national or the international scene

We have said enough to point the fact for the student that there are two main types of roto picture groups one on the subject which merely needs to be explored and exposed in all its phases, the other on the subject which needs to be explained so that the mind can grays it

These are the sustained interest layouts, and the "continuities" or progressive interest layouts to which we referred in an earlier chapter. Either kind of picture group or roto page tells a slory but it does not do so in the same fashion. A group of pictures taken on college campuses where youths are demonstrating against a ruthless war in the Orient tells the story of the reactions of young Americans today, but there is no progression in such a story. The reader will be interested and he will group the facts on matter how the shots are arranged on the page. Therefore this is the type of layout which should seek a certain variety in picture sizes and shapes, rather than rows of photos cropped to the same size.

The pretoral feature story of how cellulose becomes "alk' stockings, how a new dance step is executed, how heredity is studied through experiments with mice, how the design of the automobile has been transformed since the earliest horseless

wagon—these are all subjects which demand that the mind follow them according to a sequence The layouts should reflect this orderly progression, using numbers if these are needed to put the sequence across, but not otherwise

The test of how good a roto feature is, is the extent to which the picture group tells its own story, without the help of captions The ideal pictorial feature would be so lucid that it would require no text at all Such a happy result is seldom attained Nevertheless, the nictures must tell their story, with as little help from captions as possible For this it is necessary that the subject be well thought out in advance by the picture editor or by whoever assigns the photographer to get such a feature series. If it is a local feature, the editor should not rely on the cameraman to "go out and get some shots along this line," hut should know in detail what he intends the picture group to show or to explain and should list the shots which he thinks are essential for the exposition. If the nictures have been received from one of the services, he should select them and crop them with the same thoughtful care, to see that each one adds something to the theme of the layout

So, the roto of today does not use scattered shots of this or that, nor "heautiful" shots of no intrinsic interest. It uses pictures with a thought behind them, picture groups with an idea or theme, page layouts that have a story to tell. With this one condition, that there must be a thought content the rotogravure can roam the contemporary field, far and wide, finding its material in almost everything.

# SELECTING ROTO PICTURES FOR COPY VALUES

Black-and white glossy prints to be used for rotogravure cannot he retouched in the art department. This does not mean that they will get no retouching. A good deal of careful work will he done by the engraver on the film to bring it up to certain requirements for intaglio etching. It does mean that as nearly perfect copy, from the reproduction standpoint, as can be obtained should be selected for this section. The standards set forth earlier in this hook, by which copy is judged for sharpness of focus, clarity of outlines and details, and good contrast in tone values, should be rigidly adhered to in choosing pictures for roto, since the gravure process softens outlines and details. The

shadows should show detail and tone contrast, too, lest they become splotches of monotonous dark tone in the printed picture

# PREPARING ROTO PICTURES AND PAGE LAYOUTS

The all-insert layout, as described earlier, is used for roto pages Pictures are never pasted down, as for some kinds of halftone work

The layout is drawn to actual size on white Bristol board, showing where each picture and cutline and the page heading are to appear — Each picture is cropped and scaled for the spot it will occupy, the cropping being indicated with light pencil lines on the back of the print — For roto pages which carry advertising, dummes showing these ads must be furnished by the advertising denartment before any layout can be made

The easiest procedure for laying out a roto page is as follows. Thumbtack a large sheet of Bristol board to the drawing board, truining it with the T square. Rule off on it an oblong with light pencil lines, in the exact page size, and rule in outlines of ads

Now lay down over the Bristol board a large sheet of transparent tracing paper and thumbtack it in place

Trace onto it the page outline and the outline of any ads

The remaining space on the page—or the whole spice, if there are no ads—is to be filled with the picture group which has been selected Choose the first or key picture, and ship it under the tracing paper (between this tracing paper and the Bristol board), pushing it up into the upper left-hand corner of the page. Per haps you wish to use this picture same size, without reduction or enlargement, but cropped on the left and right to remove back ground. Push it over to the left so that the line of the page frame crops it on the side as you wish it to be. Now takey our penel and rule a line for the right-hand edge of the picture on the tracing paper, cropping it as desired. Complete the oblong for the picture with a horizontal rule. You now have the exact culline of the picture as you wish it to appear sketched onto the tracing paper. Remove the picture and lay it to one side but put no roop marks on it until you see bow the whole layout works out.

If the page is to have a heading in large type a space for this should be blocked off on the tracing paper at the top of the page

The lay out is completed by trying the various pictures under the tracing paper and sketching in roughly on this the places they will occupy in the layout, leaving spaces of course for the necessary cutlines on each picture. It may be necessary to revise the arrangement somewhat, in order to get the pictures in with the hest layout possible, but false moves will be easy to erase and correct on the tracing paper.

When the layout is satisfactory on the tracing paper, true up the lines you have sketched on this with T square and triangle and identify each picture space and caption space with a letter or number. Thus the first picture space will he marked (1) and the second picture space (2), while if a single caption serves for hoth these pictures, the caption space will be marked (1) (2). The space for the page heading will be marked "Heading"

Now slip one picture at a time into its exact position under the tracing paper and, with a pin or the point of a compass punch a small hole through tracing paper, neture and Bristol board at each of the four corners of the oblong sketched on the tracing paper. If the picture is to be enlarged or reduced, however, only the Bristol hoard and not the picture itself should be thus marked. When this has been carried out with each picture in the layout, the boles on the Bristol board will serve as a guide in ruling the completed layout with fine black. India ink lines.

Pictures to he used same size will he cropped by joining the punched holes with light pencil lines on the hack. Those to be enlarged or reduced should have any desired cropping lightly indicated with pencil lines on the hack, attention being paid of course to the fact that the picture must scale to the space allowed for it

Then each picture will be marked with the number corresponding to its space in the layout, and the numbers will likewise he transferred to the Bristol board. When the roto is done, as usually, by an outside plant, layout and pictures should be rubher stamped with the name of the newspaper, the date of the issue for which they are intended and the number of the roto page thus.

Washington Post Roto
Date Sunday June 26 1939

# PREPARING THE ROTO CAPTIONS

With the page layout completed, the next step is to prepare the captions. As these are photographed by the engraver and included in the etching of the whole page, they must be set in the newspaper composing room and perfect proofs pulled on glazed or coated paper. These proofs of the cutlines are furnished the rote engraving plant along with the layout on Bristol hoard and the pictures.

Roto cultines must be written to fit There is nothing the engraver can do ahout it, if the lines furmished him will not go into the spaces indicated. That seems self-evident, yet the heginner usually overlooks the fact that it is he himself who must make sure that the cuthines are right for the spaces in the layout and that they have hene proofread and corrected and are perfect hefore the final glazed proofs are pulled. Moreover, he should not overlook the fact that cuthines are set on the ad machines in the composing room and that, if they are not written to fit in the first place and have to be edited and reset, he may face many hours of delay hefore he obtains the proofs without which his page of noctures cannot be started on their way.

There is a very simple procedure for writing cuthnes to fit the spaces set aside for them in the roto layout. Have set and keep on hand a good sized block of type in the size and face regularly used for such cuthnes. Before writing a cuthne ship this under the space for that particular caption on the transparent sheet and count the number of words, estimating of course for a caption with enough white space all around number of words or slightly less, but not more, for then you are sure to run into trouble. Anyone who has been writing roto captions for some time will learn to estimate them with a glance at the space on the layout, but until that time it is best to follow this method

When the first proof of the cutlines is ready it should he carefully scanned for errors, since there will be no chance of correcting these after the copy is in the engraving plant. Then each cutline should he slipped under the transparent layout to make sure it fits the spot intended for it, for sometimes the wrong measure is used in setting. The cuttor either may have marked each cutline with the proper pica width or may have passed the trans-

parent layout to the composing room along with the cutlines, each numbered to correspond with its place in the dummy, and indicating the margin of white space he desires A printer will then mark them up for the precise pica width needed in each case

When the cuthnes are corrected and in their final form, a half dozen proofs should he pulled on glazed paper. The Bristol hoard layout, the pictures, and these cuthne proofs can then be forwarded to the engraving plant, together with any advertising copy which is to appear on the page. It is well to examine the glazed proofs, which are pulled on a hand press, to make sure they show no hlur or "halo" of ink around the letters, which would mar the clear-cut typographic effect of the finished roto

Ben Day Background for Roto Captions If roto captions occupy much space on the page, they may to some extent detract from the unity of the layout This can usually he overcome hy having the engraver use a very light Ben Day pattern over the captions, giving the whole caption space a tone which makes it more harmonious with the rich effect of the pictures when reproduced by this method. All that is necessary is to mark the caption spaces on the Bristol board with a lightly penciled notation "Tone here" or mark the layout at the top "Tone over all caption spaces"

Three-dimensional type gives interest to two- or three-word page headings. Hugh Miller, picture editor of the Washington Post, has developed an interesting method of othaning this dimensional effect without the use of the regular dimensional type faces. He has the head set in a sans-serif face of adequate size (24 point to 42 point), has a proof pulled on coated paper, then photographs this proof at an angle. The resulting photograph shows a "shadow" effect helinid each letter, giving it depth. It may be used as dark lettering on a light hackground, or a positive may be obtained, showing white lettering on a dark hackground. This method should prove of interest when the three-dimensional types are not available.

#### CHOICE OF ROTO INKS

Most rotes which are not in full color use either hrown or green ink. A good sepia tone undouhtedly looks richest and seems to hring out the quality of the gravure printing hetter than any other. Too much red, or henna, tone to the brown detracts from its appearance Picture editors should watch the tone and insist that the gravure plant keep it right

# COLOR IN THE ROTO

Recent strides in color photography and color printing are bringing full-color reproduction into many roto sections through out the country Costs, both for good full color photography and for color gravure work, are still bolding many back, yet it seems likely that, as rotogravure sections are modernized and , popularized, they will be able to sell enough full-color advertising to compensate for this increased expenditure

There are some things to be said for, and some things to be said against, roto color pages. Often the subjects chosen do not ment such costly reproduction. Here again, the technician seem to have outdistanced the editors, who so often forget that a picture, even if in color, must bave content which is capable of holding the interest of the reader. A color photograph, no less than a black and white, should be strictly judged as a news feature subject and should be eliminated if its rating is too low. It seems very likely that the newspaper of the future will send its own cameramen out to get feature shots in full color for roto reproduction and will maintain a studio equipped for color photography. The New York Daily News, which maintains its own rotogravure plant, is also pioneering in this field of color feature photography, on which it uses one cameraman full time

Full color photographs can be transmitted by wirephoto as readily as black and whites The color camera, it is recalled breaks down the full color image into three color-separation negatives, each of which can be transmitted over the wire This possibility is not being taken advantage of at the present time but, as the demand for good color features grows, it undoubtedly

will be

#### ROTOGRAVURE

Engraving and Printing The tremendous gain in popularity of rotogravure has to no small extent been due to the technical advances that have been realized in this kind of reproduction. The criticism used to be made that whereas in halftone it was possible to do considerable retouching to improve copy, in roto work no correction of the original copy was possible. Small text

type, reproduced in roto in the form in cuttines or reading matter, was subject to detenoration which made it hard to read. Today all the criticisms have been met. Rotogravure is producing results in hoth black and white and full color that are infinitely superior to halftone. Whereas a halftone engraving deposits the ink on the paper in discontinuous patches or dots, rotogravure printing results in tone values practically as continuous as those of the original, while it closely approximates the original picture in richness and in delicacy of nuance.

Difference between Halltone and Rotograviure In the halltone it is the surface of the cut which carries the mi. The top of the dots in the light portions and the face of the metal in the dark portions impart the image in the paper. It is a relief printing surface, as we have seen. In rotograviure the upper surface of the metal is clean of im and imparts no impression to the paper. The ink is carried in tiny pockets that have heen etched down into the incital. These pockets are deep and carry more mik for the full, net hones of the peture and are extremely shallow for the lightest tones. This kind of etching is known as intaglic and the full toned quality of the printing is due to the ability of these wells or pockets to carry a larger supply of ink to thin paper than can he conveyed on flat surfaces of metal. The various depths of the pockets create the varying tone values of the printed picture.

Etching Process In the halftone process, it is recalled, the engraver rephotographed the original picture through a halftone screen which hroke up its continuous tone. The resulting halftone negative was contact printed onto a sheet if polished zinc or copper which had heen given a coating of sensitizer. The hlack portions of the halftone negative let nn light pass through to this sensitized surface of the metal, but the clear portions of the negative in a dot structure representing the tone values of the original, allowed the light to strike the coating, which through the action of light became insoluble in the developing solution. When the metal was placed in the developer all but these insoluble parts of the coating washed away. The metal plate was then etched in acid, and the protective coating resisted the acid. This and etched away only the unprotected portions, leaving the printing surface in a dat structure representing the picture, standing up in relief.

In order to get an etched plate in which the printing portions are not in relief but are etched down into the plate, a process that is similar but somewhat the reverse of halffore is employed. It will be readily seen that if the printing on metal were done with a positive film instead of a negative, it would be the dark parts of this positive which earned the tone values of the original. These dark portions would allow no light to pass, and in the subsequent etching it is these which would he etched down into the plate, while the parts around them would he left. In other words, the etched-out pockets in the metal would carry the tone values and if filled with ink would print a reproduction of the picture. This in a general way is the theory of intaglio etching and rotogravure.

The original picture is photographed in a process camera having a reversing prism, so as to obtain a reversed negative, from which a reversed positive is obtained by contact printing. It will be readily evident that the positive film must be reversed so that the final picture printed from the metal plate may come right Careful retouching is done on this positive film. There is always danger of the detail hecoming a mass of solid tone in the darker portions of the picture, and so this detail, or difference in tone values in the shadows, is emphasized in retouching and all other values of the picture are heightened or softened with a view to obtaining the best results.

This positive film is continuous tone, for no screening has as yet taken place. It will not be printed directly onto the metal as in the halftone process hut will be first printed onto a special carbon paper from which it can be transferred to the copper cylinder which takes the place of the flat halftone plate. The copper cylinder, after etching, can then be mounted in the rotary presses

The Carbon Paper The so-called carbon paper is a pigmented, gelatinized photographic paper which the engraving plant sensitizes to its own particular liking, some engravers using from 2 per cent to 4½ per cent plan behromate solution, others preferring an ammonium hichromate solution. The carbon paper will be given two exposures, the first to impose upon it the pattern of the intaglio screen, and the second to receive the picture image from the positive film

The Intaglio Screen The halftone screen was a negative screen having opaque lines on a clear background Its ratio was 1 to 1

that is, the width of the opaque rulings or lines was equal to the width of the clear apertures through which the light passed

The intaglio screen is a positive screen, baving clear rulings separating opaque black squares. Its ratio is 1 to 3, that is, the width of its lines is only a third of the width of its lines is only a timf of the width of its lihack squares. The positive screen is in reality a photographic dry plate on which an original screen with black lines has been copied and the tones reversed. It has 150 vertical and 150 horizontal rules to a square meh, crossing each other at right angles, so that each square inch of the resulting etching will have 22,500 minute wells or cups to hold the ink.

Exposing the Carbon Paper When the carbon paper is exposed under this screen, the light passes through the clear lines of the screen and strikes the sensitized gelatin coating of the paper, which is thus rendered insoluble in water. The portions of the coating which are protected by the opaque squares of the screen are unaffected by the light.

The carbon paper now receives a second exposure, in which the positive film is printed upon it The already exposed lines in the gelatin coating are intensified by the second exposure to light, and the squares hetween them, previously unexposed, now have the tones of the positive film impressed upon them action of light on the sensitized gelatin coating of the carbon paper is such that this coating becomes soluble or insoluble in water to the extent to which it has been exposed to light other words, what has been most exposed to light will be most insoluble, what has been least exposed will be least insoluble and hetween these extremes the portions of the coating will be soluble in varying degrees, according to the amount of protection from light which the positive film accorded them. So, as the lines of the screen pattern received the greatest exposure to light, these will be the most usefulde portions of the conting, while the rest of it will vary in solubility in the same manner in which the tones of the picture image varied in strength

The carbon paper after exposure is ready to be transferred to the metal cylinder First let us see how this has been prepared

The Copper Cylinder The cylinder used today represents a great advance over that which used to be employed in rotogravure. Years ago this cylinder was of solid copper, and after each etching and printing it had to be scraped to remove the

etched surface and repolished so that new pictures could be etched upon it This scraping and repolishing process required from 8 to 10 hours and added greatly to costs

Some years ago Alco-Gravure patented what is known as the Ballard process for coating a steel cylinder with a thin copper shell. The cylinder most commonly used for rotogravure today is of solid steel weighing 2,000 lb, 76 in long and 45 in in circumference. It is coated with copper by heing partly immersed in a trough of copper sulphate solution and revolved so that its surface continuously comes in contact with the solution, through which an electric current passes, depositing the copper on the cylinder. The chemistry of this process has been so carefully worked out that it is possible to calculate precisely the relations hetween the strength of the copper sulphate solution the revolutions per hour of the cylinder, the voltage and amperage, to obtain a copper shell of the grain quality and thickness desired.

Instead of the 8 or 10 hours once required to prepare a cylinder for a new impression, it is now possible to strip off the copper, recoat and polish the cylinder in 3 hours, ready to he used again. The polishing of the cylinder is done mechanically. It is washed with chemicals and revolved in contact with various polishing stones, until its surface is bright and gleaming, without trace of a line, smudge, or scratch which might mar the picture impression.

Transferring the Image to the Cylinder When fully polished, the cylinder is ready to receive the picture image from the carbon paper. This will not be the image of a single picture or of a group of pictures as in the case of the halftone metal plate, but will be the complete impression of a number of pages of a rotogravure section, arranged as they should be for the press run when the cylinder later is put in place in a press unit, for the printing of the roto supplement.

The printed dry carbon tresue is attached to the clean polished copper cylinder in proper position, with its gelatin coating next to the copper. The cylinder is then wet, and the paper becomes adhesive. A rubber roller is lowered in contact with the paper covered cylinder. As this turns, the rubber roller squeezes the water out, pressing the paper tight against the cylinder. The gelatin coating on the paper starts to swell from contact with

the water, and adheres more and more firmly to the copper as the backing or support paper is dried out by pressure

Removing the Paper When the gelatin has been firmly transferred to the copper, the cylinder is put into a tray of lukewarm water, which is gradually warmed up so that the paper hacking begins to show little bhsters, indicating that it is pulling away from the gelatin. When it has separated sufficiently, it is pulled off, leaving only the gelatin, which bears the picture image and screen, on the comper surface of the cylinder.

Meanwhile the water has washed away the gelatin which was not hardened by contact with light during the exposures of the earhon paper. The gelatin has been washed away in gradations according to the amount of bardening these exposures accomplished. Where it was hardest the water will have left the heaviest coating on the cylinder, where it was least hard, the water will have removed all but the thinnest coating.

Etching the Cylinder

The cylinder will now be immersed in six different and baths

Where it is least protected the acid will eat deep holes into the copper surface, and where it is most protected the acid will eat only the shallowest boles

or softness of the gelatin, corresponding to the tones of the original picture, will therefore determine the varying depths of the wells or cups which the acid etches on the cylinder and which will carry the ink in the printing process later on Heavy, strong acids will be used to etch the deep parts of the cylinder, and weak acids will be used for the shallow parts

The engraver must use his judgment in this and may cover portions of the etched surface to protect them from further etching when he thinks they have reached sufficient depth

Taking a Proof When etching is helieved to have heen completed, the cylinder will be mounted in a rotary proof press, where it is brought in contact with a cubber roller carrying the paper. At each revolution of the cylinder it is inked in an open trough of ink heneath it. Before the inked cylinder comes in contact with the paper, it rolls against a steel hlade known as the "doctor" blade, the edge of which is pressed firmly against its surface. This doctor hlade removes all ink from the surface of the cylinder except the ink which is in the holes or wells. As the cylinder comes in contact with the paper these transfer their ink to its surface, reproducing the picture. This proof

is studied for defects in the etching, and the plate is then subjected to one or more reetchings, until a similar proof shows it to be perfect. It is then ready for mounting on the press

Color Rotogravure So far we have discussed only rotogravure in one color, reproducing black-and-white photography color rotogravure work four separation negatives are made from the original color picture, these are used to produce positive separation films, and from each of these a color cylinder is etched one evlinder to print red, another to print vellow, another for blue, and another for black. Very careful retouching is done on all the positive films, and tests are made by several methods to determine whether they will carry the right strengths of tone to the finished cylinders, so that when printed they will reproduce perfectly the blended coloring of the original

After the cylinders are etclied they are proofed by printing one color on top of the other, and the result is studied and com pared with the original for defects These determine the reetch ings which the various plates must receive, strengthening a tone here and diminishing it there A tone already etched may be diminished by polishing off a minute depth of the surface of the cylinder at that spot, thus making the holes which carry the ink more shallow in depth The resulting slight unevenness of the surface does not affect the printing

Rotary Presswork The fully completed cylinders are mounted on the presses In color work they must be carefully synchronized, so that the paper web, passing from one to another, is in the precise position occessary for the printing of one color to fall on top of the printing of the others, without the slightest variance A few years ago it would have been impossible to priot four colors on high-speed rotary presses Today full color rotogravure is printed at the rate of 60,000 to 65,000 an hour This wonderful progress has been made possible by what is known as speed dry ink fountains, an invention of Adolph Weiss which was perfected by Alco-Gravure

Instead of the open 10k trough we have just described in con nection with the proving of the cylinder, these speed-dry ink fountains are airtight compartments placed below the cylinder in the presses, so that the cylinder, as it turns, is brought in contact with the ink, which is so fast drying that if exposed to air for more than a few seconds it would evaporate before printing

could be accomplished On these preses the doctor blade is so placed that it strikes the cylinder just before the cylinder rolls into contact with the paper, thus giving no opportunity for the ink to become too dry, since it is wiped from the surface at the last moment It does dry on the paper practically instantaneously

## A APPLICATION EXERCISES

- 1 Obtain two Sunday newspapers which have rotogravure sections Compare page by page, with respect to the contents as discussed in this chanter.
- 2 Using news of the last two weeks, write out suggestions for the same size rotogravure section as the poorer of the two examined, selecting possible pictures which conform with the principles discussed in the chapter hat
- which differ materially from both sections examined

  3. On Bristol board, lay out the first two pages of your proposed section,
  writing page headings and captions and indicating how you would order
  time! for the explanate to preserve an effect of page unity. Assume that
- writing page headings and captions and indicating how you would order tone' for the captions to preserve an effect of page unity. Assume that no advertising is used on the first two pages 4. On Bristol hoard, lay out a rotogravure page with the following ele-
- ments a 1-column, 11 in vertical advertisement, an advertisement 3 columns wide, 6 in deep, 1 horizontal picture 145 in wide, 55 in deep, one picture 3 columns wide, 53 in deep, one picture 4 columns wide, 55 in deep, and deep, and one picture 2 columns wide, 55 in deep, assume the printed dimensions of your page to be 145 in wide by 21 in deep. Indicate hypothetical content for these pictures. Write a page heading and captions suitable for the contents and the space
- 5 From the two rotogravure sections scrutinized select the picture which you regard as having been made from the best original print with respect to reproducibility value and the picture which you regard as having been made from the poorest original print. Write out briefly the faults you find in the poorer of these two pictures and the virtues you find in the hetter of the two.

#### B CHAPTER ORGANIZING QUESTIONS

- I Explain why it is not practicable at present to publish a rotogravure page or section for every issue of the daily newspaper
- 2 Explain by illustration what difference in content this restriction makes between rotogravure pictures and daily pictures
- 3 On a rotogravure page appear these pictures. The President of the United States smiling, a baby smiling just after recovering from whooping cough the head of a racehorse whinnying, the picture of a Chinese war refugee, and the picture of three minor Hollywood actresses in bathing suits at the beach. Another rotogravure page published in another paper on the same day carries these pictures a 2 column, 20 in picture of the cardio graph film showing the hearthest of a man immediately before and after execution, a 5-column horizontal inclure showing the prison doctor examin.

ing the cardiograph film, a 2-column picture of the operator of the electrocardiograph carrying the machine into the prison for the execution, a 194-column close-up shot of the face of the executed man just before the executed man with the miximum taxrapped to his urrit immediately before the execution a with the miximum taxrapped to his urrit immediately before the execution Explain the relative ments of these two pages and justify jour points

- 4 A survey made by Dr George Gallup showed that of a large number of persons personally interviewed, 70.4 per cent had read something on the rotogravure pages carrying display advertising of the paper to which they subscribed, only 37.7 per cent of the same persons had read any thing on any of the non rotogravure pages carrying display advertising of the same paper. Framine the news and feature pages which carry display advertising in the two newspapers selected for the exercises of this chapter. Be prepared to state whether you think it likely that approximately the same reader interest results for these papers would be obtained as the results. Dr. Gallup revealed. Justin your assisted specifically.
- 5 To what should rotogravure pages appeal in addition to appealing to the eye? What similarity in content appeal have the Sunday roto page and the Sunday feature article?

6 What are the picture principles which the quoted advertisement from Life magazine sets forth as a picture-selecting formula?

- 7 The St Lous Post-Dispate! In n 20-page rotogravure section, devoted its first page to a sectional heading in red, white and black and to four large pictures each of which constituted a 'pretice" of entire pages devoted to more detailed picture continuities of the same subjects on the inside pages What do you think of this idea? What would you think of this blurb or cover page idea if the section had contained only 4 or 8 pages? What specific disadvantages might have occurred had the cover jacket rotogravure page contained each instead of low meltures?
- 8 Does the fact that original black and white prints cannot be retouched for rotogravure reproduction mean that no retouching at all can be done? Explain specifically
  - 9 Why must the all insert layout be used in rotogravure?
- 10 Explain how a layout for a rotogravure page is made with Bristol board and tracing paper
- 11 What care must be taken in spacing captions and in correcting proof of captions for rotogravure pages?
- 12 Explain how Ben Day films may be used to enhance rotogravure effects
- 13 What care must a rotogravure editor take with respect to rotogravure
  - 14 Why do not all rotogravure sections use three or four colors?
- 15 Explain in detail the difference between a halitone plate and a rotogravure printing surface. How is the surface of a rotogravure cylinder after use prepared for a subsequent impression? How long does this take?
- 16 Explain how a picture for rotogravure is transferred to 'carbon paper'

- 17. Explain how the carbon paper, after exposure, is transferred to the metal cylinders How is the paper removed?
- 18 Explain in detail how an intaglio screen differs from a halftone screen
- 19 How is the ink removed from all surfaces except the depressed cups on a rotogravure cylinder?
  - 20 Explain in detail how four-color rotogravure effects are obtained?
- 21 Why must very rapid-drying ink be used in multiple color roto-gravure?

## CHAPTER XXI

# COLOR IN THE NEWSPAPER, PREPARING COPY FOR THE COLOR ENGRAVER

#### PREVIEW QUERIES

The expression 'yellow journalsm is said to have originated with the New York World's use in 1893 of saffron yellow ink in timing the dress of a comic-strip character called the Yellow Kid But did any picture in color ever find its way onto a newspaper front page prior to the twentieth century?

With the technical improvements in newspaper production why has not color photography come into general reportorial use?

Can any engraving process with reasonably satisfactory results and practicability of expense substitute for full color plates in news paper pictures? What obstacles to color pictures in the newspaper does the roller

What obstacles to color pictures in the newspaper does the roller type of stereotyping present? What are some newspapers doing to remove these obstacles?

By what colors may specific emotional tones be created in color pictures?

How has it been suggested that one color in combination with black may be used in illustrating editorial matter in the newspaper to attract advertisers to the use of color advertising?

How is electricity being experimented with to reduce the cost of color engraving?

Why do newspaper stereotypers often select a few mats out of the middle of a large bundle of them to use for color work?

WE are apt to think of color in the newspaper as particularly modern. As a matter of fact papers have been using some form of color printing off and on for 40 years—ever since Hearst's New York American splashed the "Star-spangled Baner" across its front page to dramatize the Spanish American War In four decades great advances have been made. Photography, then an art still unsuited to newspaper needs, has grown into a powerful branch of journalism, with camera reporting of major news speeded over wires from every part of the world. Color photography has been born, engraving processes have forged

ahead, so that both by halftone and by intagho etching the perfection of a full color picture can be reproduced

One might expect under the circumstances that any day full color newsphotos would be brought to us in the daily, and perhaps they will Technical obstacles are usually or ecrome once they are attacked by determined minds, and that which many label as "too costly, too slow, too impracticable" becomes the high success of tomorrow, the accepted commonplace of the day after It may be so with the newsphotos in color. The fact remains that the color work in the daily at present is not so far advanced as so no might expect after 40 years.

# WHY NOT PULL-COLOR HALPTONE?

The time required to do the etching of full color halftone plates is one of the chief factors preventing the use of this form of engraving by the daily newspaper, which must, above all things, meet its deadlines. Full color ctching is a slow and delicate process, even in the hands of skilled operators Costs of such reproduction are high, yet expense alone might not deter the newspapers from pioneering in this field. Each halftone reproduction of a single photograph in full color necessitates the etching of four cuts, instead of the one now used for black and wlute printing Present-day newspaper cuts are made of zinc, but for best results in color work the more expensive copper should be employed. Most engraving plants would be obliged to add special high salared operatives for color process work All these factors retard the day when news will be covered in color photo But that day seems bound to armye Just as soon as methods are perfected for etching color plates at high speed without the need for special skill, we may expect newsphotos to bring us the very bues and colors of the happenings they record I'ven then there will remain a variety of problems to be solved in other parts of the newspaper plant, to make full color halftone printing effective It is interesting to observe what some of these mechanical difficulties are

Not only must four halftone cuts be made for the full color job (one for the black printing and one for each of the three primary colored inks), but also the page using these must be stereotyped and molded four times, to obtain the curved metal plates that fit on the cylinders of the new spaper press. Stereo-

type mats, made under roller pressure as they so often are today, show considerable shrinkage. This shrinkage is not ectirely uniform, and might therefore throw the printing off register. The full significance of this can best be appreciated if we stop to review the facts about color engraving.

The engraver's camera for color process work is, we recall, equipped with a halftone screen that is circular so it can revolve in its frame, on which are marked the 360 deg of the circum ference. The lines of the halftone screen intersect each other at right angles. In making the negatives for each one of the colors the operator moves the screen a certain number of degrees, so that the dot patters of the color plates will not colocide. Color filters are employed to obtain negatives of the three primary colors in the original, and a negative for a hlack printing to reinforce the others is also obtained by use of a filter according to the needs of the case. Usually the operator varies the screen angle 30 deg between the black and red exposures, and 30 deg between the exposures for red and for hlue, while the yellow is separated from black and from red by 15 deg

These negatives printed on the metal and etched, result in halftone cuts with printing surfaces in dot patterns which do not coincide. If a full color halftone print is greatly colarged to magnify its surface, it will be seen that the dots of each color fall in comparatively clear spaces on the paper, except for the yellow, which can fall close to other colors without had results. Such a magnified color print has a surface speckled with dots in the three primary colors and black. This mode of printing gives excellent reproduction of a color subject, but when the dots of one color fall on top of the dots of another the results are most

uosatisfactory

Uneven shrnkage of stereotype mats tends to destroy the careful adjustment of the four-color halftone printing, which the engraver had obtained by altering the angle of the screen in making the negatives. Even if the shrnkage of mats could be eliminated, the curved plates for the presses which are molded from the mats may vary shightly, unless unusual precautions are taken in casting them. There is likewise danger of these plates not heing adjusted in perfect register on the press cylinders under rush conditions. As the paper weh passes from one cylinder to another, each ooe of the four impressions or priotings must fall

accurately into place, or the resulting color print will be "off register," jumbled and disappointing in effect

Before full color halftones of newsphotos are used in our daily papers, we must wait for (1) Simplified and less costly engraving processes, (2) stereotyping methods better adapted to this kind of reproduction, (3) development of special pressroom techniques suited to fast color printing on newspaper presses

Research, and actual progress, can he recorded in all these departments. Electric etching machines, already in use for black and white halftone, are heing experimented with in color halftone work on copper and brass plates. Copper is superior to brass as well as to zinc. The etching machines cannot so far duplicate the work of the expert color engraver, who relies on judgment and experience in etching different parts of the metal to different depths according to the modulations of tone required. All the same, it seems that the electric etcher may succeed in obtaining very acceptable results.

When copper is used in place of zinc, some of the danger of uneven mat shrinkage is removed when the stereotyping stage is reached Zinc, under variable conditions may either shrink or expand. Variations of temperature and moisture content of the mat also affect results. Some newspapers are obliged to obtain a considerable mat shrinkage in order to conform to page size, and this is regulated by the moisture content of the mats. If, however, two mats vary slightly in moisture content, the shrinkage would be too uneven for satisfactory color work even of the simpler sort to be described later in this chapter. Usually, by choosing for a color joh a few mats out of the middle of a large hindle of them, it is possible to insure that the moisture content of all he alike hut this is a makeshift procedure which would not be dependable if color printing were to be the rule, rather than the exception, in the dayly may appear.

Newspapers printing a great deal of color are now using a sterestyping machine which applies direct pressure with heat to the mat, replacing the roller type of pressure. The heating unit hakes the mat onto the form at the same time that the pressure makes the impression, thus eliminating shinikage. The roller type machine is modern and eliminates many of the inconveniences of the old steam table method of stereotyping, but for making color mats it has not proved satisfactory because

it does permit mat shrinkage The direct pressure machine with a heat unit is the latest answer to this vexing problem. When the roller machine is used a good result is sometimes obtained by transferring the page form and the mat to a steam table after the impression is made and haking the mat onto the page form so as to prevent variation.

Still other devices are employed to obtain close register. The engraver often marks the original color copy with four small. Ys which appear as type-high marks on each of the final color plates he engraves. These serve as a guide to the stereotyper in getting four mats in accurate register. These X's must be chiseled off the plates that go on the presses, so that they will not appear in the printed work.

Each improvement in equipment or technique that is found not only improves the color printing now appearing in newspapers but brings closer the day when news in color will he a reality

#### BEN DAY COLOR WORK

In the meantime, Ben Day color work, in one, two or three colors and hlack, is heing widely used by newspapers, in feature pages and advertising as well as in the colored comics. The comics are a good illustration of the use of color with line engraing. The same process may be employed to add color to the halftone reproduction of a photograph, sometimes so successfully that the result is not easily distinguishable from the full color halftone print. The line cut (as in the comics) provides the hlack outline into which tints are filled by successive printings with plates etched to carry colored mks to different portions of the meture.

The halitone cut of a hlack and-white photo or wash drawing can likewise serve as the background or basic picture, on which tints are superimposed by printing with Ben Day color plates. These plates produce solid areas of flat time rather than the hlended gradations of color of the full color process print. To under stand Ben Day color work better we must again turn hack to the engraving plant. The engraver, we know, makes a negative from the original picture and prints this negative (which is either in line or in halitone) onto a sheet of sine which he has specially prepared to receive the impression

The zinc was first carefully polished and then coated with a substance which was sensitive to light, so that the metal might receive the image from the negative much as a photographic paper would. This sensitive coating was flowed onto the plate which was then inverted and whiled over heat to dry it evenly over the whole surface. The metal now has what the engraver calls a "cold top" and is ready to be exposed under the negative in a contact printing frame with powerful are lights. Wherever the light, passing through the negative, strikes the cold top, this hecomes insoluble in developer, but where it is protected by the opaque parts of the negative it remains soluble and washes away when the print on metal is developed. The cold top that remains is an exact print of the image.

Ben Day with Line Engraving If the original for the Ben Day color job was a line drawing, the engraver makes one line cut in the regular way, to he used for the printing in black Next, he reprints the negative on zine for each of the color plates, but after developing the image be uses a weak and solution to ordize faintly the unprotected parts of the metal. Then he applies a "cold top remover" which destroys the printed cutline but leaves the trace of the image produced by the oxidation, which serves as his guide in printing Ben Day pattern on the plate where color is desired. The metal plate, with its oxidized image, is known to the engraver as "a stained print."

In laying the Ben Day, the operator follows the indications furnished him by the artist with the original drawing. A sheet of transparent paper was attached to the back of the original along the upper edge and folded down over the face of the picture. On this transparent sheet the artist painted the colors he wished to have added by means of the Ben Day. The Ben Day screen, as we have already learned, is a plate of hard, clear gelatin on which a pattern has heen impressed, so that the surface is a fine printing relief surface, resembling somewhat the relief surface of a halftone cut. Some Ben Day screens exactly duplicate halftone dot patterns, and they are available in various dot sizes or strengths.

The engraver prepares the stained print to receive the Ben Day by first painting on its surface with a water-color paint called Gamboge, with which he covers up or "masks" all parts of the picture on the metal which are not to receive the Ben Dav Thus, if he were working on a stained print representing a picture of a girl and had directions to lay Ben Day for the printing of flesh tints on face, arms, and legs, he would first use Gamboge for "staging" or masking all but the face, arms, and legs in the picture Next, he inks the Ben Day screen with acid resistant ink, capable of producing a new "top" on the metal He then lays the screen face down on the metal and rubs it to make it impart its inky pattern to the metal He may apply a faint Ben Day dot pattern to one area and a stronger dot pattern to another, where a strong tone is desired Finally, where the strongest tone is desired, he paints over the part on the metal (which of course was not masked out with Gamboge) with a solid coating of asphaltum or acid resistant ink The purpose of the Gamboge was merely to prevent the Ben Day screen from producing a top on the metal where one was not wanted In printing with the screen there is bound to be some "run-over" of the pattern, but this falls on the Gamboge, which is soluble in water and can therefore be washed away very easily It is in this fashion that the engraver is able to lay Ben Day neatly in the exact spots where it is needed

When the Ben Day printing is accomplished, and the Gamboge, together with the excess Ben Day pattern, has been washed off the metal, the plate is ready to be etched in the usual way, and the etcling acid attacks it everywhere except where it is protected by its new ink top. The resulting color plate shows a printing surface consisting of large and small dots and solid areas. These will carry the colored ink to the paper in three different tones Such a plate, for instance, if inked with green, would print faint green dots, heavy green dots, and solid masses of green. One such color plate, used with a line cut for the black printing of the outline, might give an attractive illustration for an advertisement or feature story. Three Ben Day color plates, printing with inks in the primary colors, would give a pleasingly nuanced result.

Ben Day Color with Halftone The process just described may be similarly carried out with an original which is n photograph or a wash drawing For such a "continuous tone" picture, the engraver makes n halftone negative He prints this negative on zine and finishes one halftone cut in the regular way, to

be used for the black printing. Now he reprints the negative on the metal, once for each of the color plates required. The zinc just as for the printing of the line negative, has received a light sensitive coating or cold top. After the image has been printed and developed on the metal, this top remains in dot formation on the surface.

When this stage is reached, the engraver uses a weak acid on the metal print, which faintly oxidizes all the unexposed portions of the surface between and surrounding the data. With a cold top remover he now destroys the cold top print, or dots, on the metal. There remains, however, a faint image of the picture caused by the oxidation. This is his "stained print," which guides him in laying the Ben Day

The original photograph came to the engraver with a transparent overlay on which the desired colors were indicated. He now refers to this, and earnes out the Gamboge staging, or masking of the metal with water-color paint wherever Ben Day is not to appear. When this is done, he prints onto the metal the fine or heavy Ben Day dot pattern as he thinks necessary to produce the required tones. He may paint over a whole area with asphaltum where the strongest tone value is needed.

In making each one of the color plates, he of course applies the Ben Day differently, in accordance with the amount of that particular color that must show in the final printing of the picture A single color plate may be used to supplement a black halltone printing. On the other hand, the nearest approach to the effect of a full color halltone process pob may be realized by the use of a halltone cut for the black printing with three Ben Day plates, each in three grades of tone value, for the printings with taks in the three primary colors.

# How the Copy Is PREPARED

Reference has been made to the way in which the original copy is prepared for Ben Day color work. Now that the engraver s work is understood, let us look at the art-department job in a little more detail

The artist is preparing directions or copy which must serve as an absolute guide to the operator in laying the Ben Day on the metal Ben Day prittern, we have seen can be "strong" or "weak" in different areas of the preture, but it cannot shade off from one tone into nnother In preparing the color original this is something to be kept in mind

Over the block-and-white photograph, wash drawing, or hie drawing, as the case may be, the artist phoes an overlay of heavy transparent paper. This is guinmed to the back of the picture along the upper edge and folded down over the face. On this transparent sheet, in either water color or colored crayon, he paints in the tones he wishes the engraver to provide by means of the Ben Dny. Thus, he may want only one color plate for use with the black plate. In this case he will paint in three tones of green to be followed in the Ben Day by the hight dot, the heavy dot, and the solid surface. Though he uses the three tones, he does not shade one into the other gradually, but instead he definitely indicates in his painting where one this ends and another begins. He washes in a pale green then mixes a deeper green and washes that into another portion of the picture, finally he mixes his darkest green and washes that into appropriate areas.

If the artist is experienced in color work, he will be able to prepare a single overlay even when three color plates are to be made On this single overlay he will give the Ben Day operator clear indications of what is required, despite the fact that three colors, in three strengths apiece, are used. Where a tint of one primary color is washed over a tint of another, the engraver will be able to judge how much tone he must put into each color plate to achieve the combination of color when the picture is printed, with inks of primary tones superimposed. If printing is to be effected with black and three colored inks. all in secondary colors, then the artist must not wash one color over another, but must mark the separations elenrly The overlay, then, must show clearly where variations of tone start and stop, but can usually combine all three colors on one sheet Water color is better than crayon for the work, provided a good quality transparent paper is used which will not buckle

# SELECTION OF INK FOR COLOR PRINTING

Color and depth of tone of the inks used in Ben Day printing will naturally have much to do with the results. In four-color printing with Ben Day, inks in the primary colors—blue, red, and yellow—may he used with black. Where only one color other than black is employed, the ink may represent a com-

bination of the primary tints For instance, an orange ink for the color printing will give in combination with the black an effect like a tinted wood cut

To quote one modern designer, Willard Grayson Smythe, writing in The Printing Art Quarterly

Fine results may be obtained by using color to create a definite emotion. We array at these emotions by relating them to the experiences in nature of which we are a part. For example, Heat, fire, blood, and existenent in nature are experienced in red, it is a strong, ital color. Yellow is the color of cheer, life, and sunshine, it has a revivity ing effect. Blue is significant of purity, truth, coldness, and formality, it is a color of distance. Binary colors, each formed by two primatics, also have meaning. Ornage, made of yellow and red is symbolic of light and lie to Violet, composed of red and blue, is symbolic of heat and cold which results in ashes, it is a color of mystery and gloom Green, composed of yellow and their, is symbolic of light and coloness.

The noted newspaper designer Gilbert P Farrar, in an article which appeared in Editor and Publisher, advised newspapers to go out after increased advertising revenues by printing color and soliciting color advertising. He believes the best way to begin is by printing in color some daily feature which will attract the attention of the local department stores, such as the illustration for a daily pattern on the woman's page, using just one color in combination with black, but changing the color every day. He says

Use colors of high tone value but of high brilliancy also. What you want when you use just one color for an entire picture is a brilliant spot of color that will startle the reader. Have a cycle of about five good colors. A good cycle is Fiery Red. Persian Orange, Alice Blue, French Green, Lavender, and Tan.

Some of the mechanical problems we described in connection with halftone color printing for the newspaper cuist also in the simpler Ben Day color printing, though not of course to the same degree Reproduction in color naturally fails to please if it is greatly off register Stereotyping and pressroom difficulties discourage some from attempting more than one color added to the black printing. Others have been entirely successful in doing four-color printing. Here, too, certain modifications may meet the particular newspaper's requirements. The most

difficult four-color Ben Day printing is that in which one primary color prints over another primary color, to obtain a secondary color. Thus, blue ink printed on top of yellow will give given but very accurate register must be obtained where secondary tones are built up in this way. It is not always possible to guarantee the exact tones of the final colors, which may be affected by various factors—the inks used, the speed of the presses etc.

Instead of four-color printing with primary inks, some news papers use four color printing with inks in secondary colors, but with no overlapping of the inks This method is very satis factory for color advertising in the daily A department store may send along with its ad copy samples of the materials of which the advertised dresses or curtains or upholstery are made There is no attempt to produce these tones by overlaying the inks, but instead inks are mixed to exactly match the colors of the materials supplied and the color Ben Day plates print contiguous areas of the surface of the picture cut for the basic black printing, amazingly fine results are procurable by this method Gowns, rugs, house furnishings and merchandise of many kinds can be illustrated in color advertising which identically reproduces their hues Such color work is not too difficult for the average newspaper to attempt and will be a source of satisfaction to merchants and of revenue to the paper in the end

To sum up what we have said concerning the Ben Day color process for newspapers, its advantages are (1) It is easier and cheaper to carry out in the engraving plant, (2) the plates can be etched on zinc like other newspaper cuts, rather than on the more expensive copper, (3) though perfect register is always a little difficult to obtain something close to it is possible with study of the special problems, and slight variations will not mar the effect as they might that of full color halftone, for the Ben Day tones are large areas not dependent for their effect on each dot falling into a mathematically exact position in relation to the rest

Newspapers should do more color printing for a number of reasons, perhaps To begin with, it is a simple means of "pepping up" the paper and giving it a new dress! It is a great post ble source of advertising revenue Lastly, if color in newsphotos is ever to arrive, as it doubtless will, color printing in the simpler Ben Day now will do much to smooth out the existing technical and mechanical difficulties and prepare the path of progress

#### A APPLICATION EXERCISES

- 1 Get a current newspaper come supplement in color Explain how many successive printings were necessary to produce this colored supplement as it appears
- 2 Explain why some of the colored areas in these comic pictures appear in dot formation, whereas others are solid colors
- 3 By reference to a particular picture in this come supplement explain how the dot formation areas differ from the dot formation areas in a full color process halftone
- 4 Select a photograph Assume that you wish this photograph reproduced in a newspaper with only one color plate besides a black plate. With the use of transparent paper, indicate how you would prepare this photograph for the engrave to make one black and one Ben Day color plate, the Ben Day plate to show three different shades.
- 5 Get if possible a picture supplement of a metropolitan paper which contains full-color plate reproductions of color photographs. Write out a detailed comparison of the color work in any one of these full-color plate pictures, comparing it with a Ben Day effect in your comic supplement, to show how the processes duffer.

# B CHAPTER ORGANIZING QUESTIONS

- 1 Explain in detail why it takes so much time at present to prepare the full-color halftone plate for reproducing one picture
- 2 Why is copper a more satisfactory metal than zinc for color plates? What drawback, on the other hand has copper for newspaper use?
- 3 What increased labor in the stereotyping room does full-color printing necessitate?
- 4 Why is the number of plates required for a full-color reproduction four?
- 5 In using several different plates for one picture as color reproduction requires, what would result if the dot pattern of the various plates coincided? How is this reuarded against?
- 6 What complication does mat shrinkage present in a newspaper's use of color reproductions? What is done to lessen this difficulty?
  - 7 What devices are used to decrease the difficulty of imperfect register? 8 How does a Ben Day screen differ from a halftone screen?
  - 9 Explain in detail what is meant by a cold top"?
- 10 What is meant by a "stained print" in the Ben Day process and for what purpose is it used? What is Gambore and how is it used?
- 11 How may one Ben Day processed plate give a final printing effect of three gradations of color?
- 12 How does Ben Day use with a halftone differ from Ben Day use with a line-drawing cut?

- 13 If three Ben Day plates taked with primary colors are used with a fourth black plate to produce a nuanced result, why would they cost the paper less than four full color plates?
- 14 Explain how a photograph is prepared for color reproduction so the fingraver will know exactly where the various kinds of Ben Day screens are to be used?
  - 15 Suppose in water coloring a layover on a print for Ben Day work, the picture editor or artist shades one tone into another gradually Why cannot the engraver follow this?
  - 16 What emotional tone is violet said to create in a picture? Orange? On what reasoning is this based?
- 17 Why do you suppose Gilbert T Farrar recommends using one color only for a daily illustration to attract advertisers—but changing the color every day?
  - 18 What kind of colors does he recommend?
- 19 How may department store advertising in color effectively copy colored fabrics to be advertised?
- 20 What mechanical contribution may the use of Ben Day color work make to an ultimate newspaper use of full-color printing?

#### CHAPTER XXII

## PHOTOGRAPHY AND THE LAW, LIBEL, ETHICS, COPYRIGHTING

#### PREVIEW QUERIES

Charles A Dans once said, "What the good Lord permitted to happen, I'm not too proud to print" Suppose a law-abiding citizen is unjustly accused of a crime and arrested for investigation. The law coincides with Mr Dana's dictium in permitting a paper to publish this man's picture, provided its caption is correct. What about human nature raises a question of ethics in such publication?

Is a newspaper photographer always at liberty to reject a picture possibility because of ethical acruples?

What constitutional guaranty may become involved in any sweep-

ing proscription of picture reporting?
What difference in legal point of view exists between n photograph published for advertising purposes and the same photograph published to report current news?

In what circumstances is it possible for a true candid picture to misrepresent a person to that person's injury?

In what circumstances might a photograph of a corpse be in execrable taste if displayed in a private drawing room and yet be in good taste and its nublication ethical in a newspaper?

What news photographs do you recall having seen in the last year which seem to you definitely unethical in publication? Can you suggest a sound law, which you think ought to be passed, which would have prevented the publication of any or all of them?

A reputable banker is photographed at lunch in a public restaurant with a man who some weeks later is convicted of selling fraudulent stock. Assuming that the picture is bona fide but the meeting at lunch was casual, is it ethical to publish this picture at the time of the swindfer's conviction? Is it permitted by faw?

DIATRIBES against unethical news photographers invariably get attention, as do suggestions that their activities must he legally curhed. The remarkable fact is that we see so broad a camera coverage of news with so little that in any way offends. The reasons are evident to those who have day-to-day contacts with the cameramen. Taken as a class, like the men in any profession, they have character. Work that requires technical

385

skill, intelligence, and a sense of artistic values breeds self respect Self respecting people respect others. In moments of stress and great emergency they may do their utmost to carry out the commands of an executive, but they do not trample on the rights of others.

Criticism undoubtedly results largely from the fact that the field of the news camera is expanding rapidly and that all conceivable legal and ethical problems have not yet been solved A cameraman of long expenence on a metropolitan paper said recently

I have always felt it was committing an injury against the individual charged with a felony to publish his photograph before he had been convicted Of course I have taken many such pictures. Legally they are permissible so long as the arrest or the indictment are matters of record. But I have often wondered how I should feel if I myself were innocently accused of a crune and had to see my face spread all over the newspapers. Even if I was acquitted later, most people would only remember that they had seen my face in print in connection with a crune. For many pay more attention to pictures than they do to words

It is obvious from this one example that questions of ethics and of law are closely interrelated and that the photographer acting under orders, cannot always he responsible for hing up to the highest standards of conduct in circumstances where no legislation exists. The passing of laws is made difficult by the determination of the press to guard its freedom guaranteed by the Constitution, yet if pubbeation is deemed injurious to circens and prejudicial to justice, it can and should he restricted

Just how much harm publication of the pictures of accused persons does must therefore be decided by the lawmakers of the future. Persons under arrest and in jail on eriminal charges frequently do object to being photographed. Sometimes they welcome photographers. The lower the grade of the individual the more apt he is to relisb eimer a notinety. The choice, however, is seldom his. In cities where law enforcement officials have reason to keep in the good graces of the press prisoners are usually brought out of their cells and obliged to face a camera barrage, whether they wish it or not. It would be unfair to say that this is a positive evil, though many severe abuses have been observed. Yet sometimes newsphotos have created a public sentiment in favor of the innocently accused, which made

acquittal more certain. The problem remains one demanding proper consideration

Of course when the case reaches the trial stage the judge may intervene to har photographs. Here again it is difficult to say what is right and what is wrong. Many feel that there is as much reason to cover a big court case pictorially as by the printed word. Certainly to do so conveys the event to the mind of the reader far more trabheally than words can do

At present, photographers are barred from all federal courts and may not even make pictures on the steps or outside property of the court. Elsewhere their presence is at the judge's discretion. Practice is gradually changing, partly in recognition of the fact that the pubble demands its news in picture form, and partly because modern photo equipment permits pictures to be made without disturbing the decorum of the courtroom, as in the days when flash powder and tripod had to be used. The photographer who makes pictures despite a judge's adverse ruling is in contempt of court and may be subjected to fine or imprisonment. When such a picture is published, the newspaper executives are often held equally responsible under the law. Most judges are inclined to regard camera reporting as legitimate and to allow the news photographers to operato as freely as reporters may.

### PHOTOS THAT CANTOON OR MISREPRESENT THE SUBJECT

One of the ethical charges the enties make concerns photos that cartoon or misrepresent the subject. It is possible to photograph a person at an angle or to catch him in an expression or mood which is unfavorable to bis best interests when the likeness appears in print.

Frankim D Roosevelt, during his second Presidential campagn, was much annoyed by the publication of a candid shot which showed him with his hand to his brow in an attitude of dejection. Undoubtedly the picture revealed only a passing gesture of wearness, but there was some danger that to the public it might carry the thought that he anticipated defeat. It can be said in defense of such a shot that it is no different from the cartoonist's unfavorable presentation of the subject. Yet a photograph, simply because it is a photograph, does carry its message more forcefully to the mind.

When the subject of a photograph is a political figure, it would seem be cannot defend himself against photos that carbon or even those that "he " When the subject happens to be a private individual, the case is altered. If the published photograph is one which tends to hold him up to scorn or ridicule and thus injure him in his social or business relations, he may have ground for a civil lihel suit against the newspaper.

#### NEWSPHOTOS THAT HORRIEY

Only a few years ago newspaper ethics forbade the use of photos of corpses, whether accident or murder victims. Public feeling and newspaper practice in this respect bave changed. There is almost no horror which is excluded from picture reporting today. We are shown photographs of lynchings, of auto accidents in which people died, of the charred victims of air crashes, and of the mangled remains of soldiers and civilians massered in foreign wars. We no longer insist on delicate refinement in the representation of actualities, and that is a decided gain, provided it spurs us to face reality and find cures for the worst of our modern plagues.

Where offensive pictures do not serve any constructively humane purpose, they should be rejected. There has been a tendency in some of the picture media to invade the hospital operating room and the realm of the vivisectionist, in search of a wider range of subjects which might pander to sadistic appetites. The border line between science and sensationalism should be very sharply drawn

#### MINOR ETHICAL OFFENSES

Compared with these larger ethical problems, some of the lesser enticisms leveled against news photographers seem more laughable than serious. The cameraman who planted a smiling lady pygmy on mighty J. P. Morgan'a knee during a Senate inquiry and then proceeded to catch the hanker in a "candid" pose, was guilty of lèse majeste, perhaps. It is even possible he subjected the financier to some humiliation, but the injury was not severe.

Photographers who have pursued and photographed the Lindberghs in all the happy and tragic events of their lives were legally within their rights, though ethically, under the spur of competition, they may bave gone too far Yet it is hard to say where the line could be drawn. Even those who are fond of saying there "should be a law against it" would have difficulty framing such a law

#### RIGHTS OF PRIVACY

As a matter of fact the strelly private citizen is in the process of gaining some protection under the statutes, in his right not to have his photograph published. Just bow far such protection now extends is doubtful. For advertising purposes his face may not be used without his permission, but much greater leeway is given the news columns than the advertisers.

Theoretically, a man owns his own face and all rights of reproduction thereof. In point of fact, this property right runs some what counter to the Constitutional right of the newspaper to 'publish anything which commits no offense against public morals or private reputation." When the Constitution was framed news photography did not exist, yet the hest thought on the subject seems to be that "freedom of the press" necessarily embraces normal camera reporting and that persons included in such pictures have no redress

Many newsphotos hear within themselves the evidence that the subjects represented posed willingly, and therefore there can be no danger that the publication "invaded the rights of privacy". Such a danger sometimes may exist where a picture from the newspaper morgue or from some other source is used with a story creting facts which are discreditable. Thus, if a story of Kidnaper John Doe were illustrated by a group shot of the criminal with some of his old school friends, these persons might have grounds for a civil suit against the newspaper, for having thus brought them into social discredit. It is doubtful whether they could prove actual injury, yet here is a twist of the law that the nicture editor should bear in mid.

#### NEWSPHOTOS VERSUS COMMERCIAL PORTRAITS

Legally there is a difference in status between the picture made by the news cameraman and the portrait made by a commercial studio. If a citizen, whether in public or private life, pays a commercial photographer to make his portrait, he has a right to demand that it shall not be used for publication and, in fact, that no copies he delivered to anyone other than himself. The negative belongs to the photographer, unless otherwise contracted but prints from the negative are the property of the sitter.

Commercial photographers very often request their chents to sign a form of release permitting such photographs to be furnished to the newspapers and to be used for publication. Such releases are readily granted in many instances. A woman may be told that her picture has been requested by the local society editor If a general release is signed, the commercial studio may sell prints to the newspapers at any time. Years afterward, if the sitter comes into the news, the negative may be withdrawn from the files printed, and sold

It is evident that the entizen's right to keep out of print the portrait for which he paid is based on his purchase of it. If he did not buy it, but allowed the photographer to take it and accepted some of the prints as a gift, he has not the same proprietary claim to it. It then becomes subject to much the same conditions as the news photograph, even when made by a commercial stidio.

Doen news photographers, when they pose subjects in the newspaper studio usually get a written release as a guaranty against may attempted legal action, though it is doubtful that these are necessary, since no payment is made by the after Strictly speaking, some of these pictures, made for feature pur poses, are not news coverage, and therefore the written release is an added precaution it is well to have

is an added precaution it is well to have
Releases are always obtuned when professional models are
used Sometimes the situations in which these models are posed
are such that, but for the fact that they had signed such a release
covering all uses of their picture, they might later claim mighty.
Take for example the case of the heautiful child model who poses
in rags as the pitful abandoned orphan. Newspapers, it is true
make hitle or no use of models for such purposes, but they do
publish such pictures when furnished them by the charitable
institutions, which habitually employ models in their funding
campagins. The newspaper, on the other hand uses fashion
models frequently. All such photographs should be covered by
written releases which in the case of minors, must be signed
by the parent or guardian.

Ł

In summary, we see, then, that a growth of ethical feeling is resulting in keeping some pictures out of print and may result in harring still greater numbers, while statutes to protect the individual in his right to privacy are responsible for stopping the publication of others Ethics change with every age, and the picture editor must have his ear to the ground for the rumblings of public sentiment, if he does not wish to be too bitterly criticized Women who were long skirted hathing suits and black cotton stockings into the ocean in the gay nineties probably would have regarded the candid camera snapshot as a piece of impertment vulgarity. The bare-legged modern bathing girl sees no harm in heing photographed nor does the society matron nor the church worker nor the husinessman, hoho, slum mother or scientist in his laboratory Milhons of people are so pictureminded today that it would never occur to them to refuse to face a camera, unless they happened to be caught in very compromising surroundings. Thus the cameraman has his task made easy With a minimum of diplomacy he can get anything that he wants

#### PICTURES THAT ARE FAKED

The charge that newsphotos are "faked' is occasionally heard and now and then is justified—rarely in our time. The truth is that real photography has driven the fakes out of the field so completely that current examples would he difficult to find (Fig. 43). Also, few of the critics would recognize a fake were they to see one, and if it occurred in a reputable newspaper—as now and then one does—they would probably not even sinff at it. When the fake is accompanied by a certain amount of sensationalism, then everyhody is up in arms.

Fakes usually belong to one of three classifications They are (1) developed from something which is not a photograph, (2) posed by models to represent an actual news event, (3) made up of parts of several photographs, in what is known as a "composograph"

Famous World War Fake In the first group belonged many "photographs" made during the World War and at least one which caused some international hard feelings Camera cover age of news had not reached its present high state of efficiency in that era. One of the large news gathering agencies employed

a staff of artists in Paris to turn out charcoal drawings, from imagination and from word-of-mouth descriptions, of "actual scenes in the fighting zone." When the flash came that a hig battle was in progress, these wizards soon had the whole realistic picture on paper, showing the American, British, or French

Fro. 43—Composites are rare in our day. This antiquated picture of the Duke of Windsor when he was still Frince of Wales, "shaking hends" with Gene Tunney, was obtained by ingeniously combining separate photos of each

troops "going over the top" The charcoal version was then airhrushed to soften and disguise the artist's strokes, photographed, retouched, photographed again. The final print looked as real as any our intrepud war photographers turn out today.

Such pictures were printed hy practically all newspapers in all parts of the world. Editors, hke the readers themselves, accepted them on their face value One of these faked frontline views caused a diplomatic stir and is said to have produced
harsh exchanges among certain high officials at Versailles. As
originally executed in Paris, the drawing had portrayed the
"Americans winning the victory in the Argonne". The print,
after it reached this country, was recontinued for each state to
which it was distributed, so that it purported to show the boys
of that particular state winning the victory. That was allvery
well, but later the picture was retouched to show "the Australian
boys winning the victory of the Argonne," "the Canadian boys,"
and the "New Zealanders". Editors in all these lands likewise
accepted it and published it on faith, so it is not surprising that
even the diplomats were baffled when the truo version of history
was presented to them.

It seems an entirely safe assumption that charcoal drawings of foreign war scenes are not being inctannorphosed into "photographis" and circulated through regular news channels today Even as faked propaganda, they would be quickly exposed, for the news cameramen of today are ready to risk their lives to give the world true pictures of what is going on

The second type of fake—the picture poved by models to represent an actual news event—is becoming equally rare. It has occasionally been used to show an electrocution from which the news cameras were barred. Cutlines veiled its fake properties as subtly as do radio aunouncements of "recorded" programs. It has offended good taste but his probably doae no harm, except to the paper. From the standpoint of those who oppose capital punishment it may even have done some good. Of course is speaking of posed pictures which ne fakes, we are referring only to those which endeavor to ape a news event. In the vast majority of cases where models are employed there is no ethical problem involved.

The third type of fake, the real "composograph," may still occasionally be found in newspapers, but only by those whose eyes are sharp. It is a photo built up out of several photos, but it differs from the photomontage in that it seeks to conceal the telltale evidence that it is not a single shot. It may show Hitler and Mussolini clasping hands, or famous athletes or royal per sonages in conclave, or the flight of an airplane over some familiar skyline. When the event is one which has great popular interest.

and no pictures are obtainable, editors sometimes seek to represent the news by this little trick of cutting out and pasting down to get a scene close to the actual one. Usually nothing is said in the cutline to indicate that such a picture is a composograph, and the reader of the very conservative newspaper might be greatly shocked if he knew it was. Yet the purpose is not so much to fool him as to give him what he has come to desire the news in pictorial form.

To be sure, the inventor of these composographs needs to watch himself against ships Airplanes (in newspapers) have been seen to fly over mountain tops with their propellers visible. On the other hand, queens and duchesses have been beheaded and their heads set nimbly onto bodies more fashionably or more seasonably garbed than they—and no complaint has ever yet been made. Famed personages have given each other a hearty handelasp with hands which never belonged to themsel es, and no hard feelings have resulted. Ladies have been made a present of a better set of legs, gentlemen have had their straw hats chopped off and replaced with fedoras. If such a composograph misrepresents the news it is a dangelous weapon. Such abuses however, would be impossible to point to and probably do not exist.

#### LIBEL IN NEWSPHOTOS

Many libel suits brought against newspapers are based on pictures or cutlines. Carelessness in identification of photographs and carelessness in wording captions referring to enuminal charges frequently result in the payment of damages. It is interesting to examine some of the ways in which wrong identification occurs. Suppose that hank teller John K Jones has been arrested on a charge of embezzlement. The picture editor asks the newspaper morgue if it has a photo of Mr Jones on file, and shortly such a picture is delivered to his desk. It bears on its reverse side the identification "John Jones, bank clerk". So the editor has a cut made and the next edition carries it. It turns out, however, that there are two Mr John Joneses employed by banks in the community, and the face which appeared in the paper was the wrong one. The honest Mr Verna are been libeled

sponds in every respect with the one sought, the photo should be used only if it can be positively identified. It may have had the wrong name written on it at the time of filing. Usually someone in the newspaper office or vicinity cao be found who knows the person and can identify the picture. Failing that, it had better not be used in connection with a story containing libelous possibilities.

Any picture of an innocent person, used with a story of crime, constitutes a libel, even though the name under the picture is that of the criminal to whom the story has reference and not that of the person represented in the photograph. Thus if the picture laheled "John K Jones, Arrested on Einbezzlement Charge" turns out to be a photo of William Smith, the latter has been libeled quite as much as if the embezzler's name had resembled his

Mistakes in identification sometimes occur when a local commercial studio is queried for such a portrait. Usually the studio has its negatives filed numerically and refers to a card file for the number of the negative of John K. Jones. A mistake in jotting down the number or in withdrawing the negative from the file might result in a picture being printed and marked "John K. Jones," when in reality it was the photo of William Smith. Of course any reputable photographer is doubly careful to check such a photograph if he is warned by the newspaper that it is to be used with a story of a crime. Even so, it will be well for the picture editor to attempt further identification of such a photograph. The newspaper photographers themselves, if withdrawing an old negative from the files, may make a similar error, and therefore the print should be checked back with the files before use.

If an old group picture is used in connection with a erime story, new dangers arise. Are all the persons in the picture charged with crime? If not, overlines and underlines abould make this very clear, for if five of them are gangsters arrested for a kidnaping, and the sixth is an honest boy who went to school with them, he will have been criminally libeled by a cuthine referring to "Kidnapers Who Were Caught". In fact, it will he well in using such a picture, to takehim out of it, or have the retoucher, blur his face heyond recognition, for he can charge that his reputation has been damaged by such subjection. If he cannot be

and no pictures are obtainable, editors sometimes seek to represent the news by this little track of cutting out and pasting down to get a scene close to the actual one. Usually nothing is said in the cutline to indicate that such a picture is a composograph, and the reader of the very conservative newspaper might be greatly shocked if he knew it was. Yet the purpose is not so much to fool him as to give him what be has come to desire the news in pictorial form.

To be sure, the inventor of these composographs needs to watch himself against slips Airplanes (in newspapers) have been seen to fly over mountain tops with their propellers visible. On the other band queeos and duchesses have been beheaded and their heads set nimbly onto bodies more fashionably or more seasonably garhed than they—and no complaint has over yet been made. Famed personages have given each other a hearty handelasp with hands which never belonged to themselves, and no hard feelings have resulted. Ladies have been made a present of a better set of legs, gentlemen have had their straw hats chopped off and replaced with fedoras. If such a composograph misrepresents the news it is a dangerous weapon. Such abuses however, would be impossible to point to and probably donot evet

#### LIBEL IN NEWSPHOTOS

Many libel suits brought aguinst newspapers are based on pictures or cutlines. Carelessness in identification of photographs and carelessness in wording captioos referring to criminal charges frequently result in the payment of damages. It is interesting to examine some of the ways in which wrong identification occurs. Suppose that bank teller John K. Jones has been arrested on a charge of embezzlement. The picture editor has the new spaper morgue if it bas a photo of Mr. Jones on file, and shortly such a picture is delivered to bis desk. It bears on its reverse side the identification "John Jones, bank clerk." So the editor has a cut made and the next edition curries it. It turns out, however, that there are two Mr. John Jonesse employed by banks in the community, and the face which appeared in the paper was the wrong one. The honest Mr. Jones has been libeled and has a suit against the paper.

Middle initials are often very significant in photo identification and should never be disregarded. Even when the name corre-

ds in every respect with the one sought, the photo should sed only if it can he positively identified. It may have had wrong name written on it at the time of filing. Usually cone in the newspaper office or vieintly can be found who wis the person and can identify the picture. Finling that, it better not be used in connection with a story containing

ous possibilities
ny picture of an innocent person, used with a story of enime,
stuties a libel, even though the name under the picture is
of the criminal to whom the story has reference and not
of the person represented in the photograph. Thus if the
ure labeled "John K Jones, Arrested on Embezzlement
rge" turns out to he a photo of Wilham Smith, the latter
heen libeled quito as much as if the embezzler's name had
milted his

distakes in identification sometimes occur when a local comcial studio is queried for such a portrait. Usually the studio
its negatives filed numerically and refers to a card file for
number of the negative of John K. Jones. A mistake in
ing down the number or in withdrawing the negative from
file might result in a picture being printed and marked
hin K. Jones," when in reality it was the photo of William
th. Of course any reputable photographer is doubly careful
heek such a photograph if he is warned by the newspaper that
to he used with a story of a crime. Even so, it will he well
to he used with a story of a crime because, if
he picture editor to attempt further identification of such a
tograph. The newspaper photographers themselves, if
herawing an old negative from the files, may make a similar
ir, and therefore the print should be checked hack with the
selective selection.

f an old group picture is used in connection with a crime story, changers exist. Are all the presents in the picture changed in crime? If not, overlines and underlines should make this y clear, for if five of them are gangsters arrested for a kidning, and the sixth is an honest boy who went to school with m, he will have heen criminally libeled by a cuthine referring "Kidnapers Who Were Caught" In fact, it will be well ising such a picture, to take him out of it, or have the retoucher, r his face beyond recognition, for he can charge that his reputana has been damaged by such publication. If he cannot be

cropped or painted out, give bim a beard, eyeglasses and a moustache in other words, make him unrecognizable and omit his name from the caption

Sometimes relatives of persons accused of a crime have charged they had been libeled by the publication of pictures in which they were shown with the one accused. It is doubtful if any court would inhold this claim, though there is the possibility that such a picture would be considered as a civil invasion of the right of privacy, in special instances

On the whole, then, the picture editor must see to it that only fully identified pictures of persons charged with crime are published with stones concerning felomes

His second responsibility is to make sure that there is no libel in the cutlines. This includes overlines and underlines. A crime story written by a veteran reporter may be carefully checked on the copy desk and the headlines written by men of experience in evading libel's pitfalls. Then—it frequently has occurred—the cutlines that accompany the picture are histily dashed off by a cub doing his turn at the art desk and rushed straight to the composing room. If such cutlines impute guilt and the man or woman is later acquitted, the libel is indefensible.

Occasionally persons who suo newspapers for libel are not wholly innocent of any guilt. The clever crook is always watching for a chance to profit by a chance mistake. The case is recalled of a cutline on art connected with a feature story reviewing the activities of a notorious underworld gang. The line stated that "the criminal John Doe was added by his wife in breaking jail." The jail break had occurred eight or nine years before. John Doe had subsequently served his sentence out, been paroled, and only run afoul of the law in minor felonies, of which he had a long list to his name. All the same, he brought suit, insisting he had "reformed" and that the reference to a past felony hebed him.

There is certainly more danger in pictures connected with a feature story of crime than in those used with a straight news story. It cannot be said concerning the feature picture that that to be used to report the news. On the contrary, it is evident that it is only used to gratify public demand for sensation and to make money for the publisher. All such pictures.

and cutlines therefore require dnuble attention from the picture editor

Whenever a lihel due to wrong identification has been committed, the newspaper should, and does, republish the picture with cutlines that explain and rectify the error. The evidence that such a correction was made will influence the court in awarding damages.

#### COPYRIGHTING NEWSPHOTOS

Very few newsphotos are directly and specifically copyrighted. This is surprising when we consider the luige volume of pictures sold and distributed by the newsphoton agencies, the newspapers themselves, and the commercial and free-lance photographers. Some photos, after publication, are protected by the general copyright of all the contents of the newspaper, but others are not, because having originated outside the newspaper they are not its property to copyright. In general, it seems likely that only a small portion of the newsphotos that appear in print are in the copyrighted class.

Commerce in newsphotos relies very largely on good will and ethical conduct on the part of newspapers, the chief producers and customers of the merchandise, and on the fact that it is difficult to obtain a print of a particular picture without the cooperation of the newspaper or agency where it originated and without paying the usual price for it. After all, even the most unusual newsphoto has a value which is somewhat ephemeral After it has been published, it is scarcely worth "lifting" by the imposition paper. Picture scoops exist, but it is also true that most important news events are covered, not by a single cameraman but by a hattalinn of photographers from all the newspapers and services. When a number of cameramen all cover the same event, their product shims a similarity which makes copyrighting heade the point.

Service pictures, such as those sent nut by mail and by wirephoto of The Assiciated Press, are nuly copyrighted in very exceptional instances. The cost of empyrighting the great flood of newsphotos made throughout the nation daily would probably be prohibitive.

Theoretically, anything puhlished without copyright is "dedicated to the use of the public" and may be copied and

reproduced hy anyone who has a mind to do so. In practice, few reputable editors would risk such procedure, and in any case, lacking a print from the original negative, they would be obliged to copy the halftone reproduction as it appeared on ordinary newsprint in the rival paper. Sometimes a newspaper, finding it has missed out on pictures of an important local event, will request the studie of the rival paper to furnish it prints for a later edition than the one in which they intend using them Seldom is such a request refused. Photographers in this way protect themselves against total failure in camera coverage

Occasionally, however, there are pictures taken which are so unique in character, so exclusive to the paper or the agency, and so valuable from a commercial standpoint that it is desirable to copyright them, in order to protect all possible avenues of sale Pictures of the Dionne Quintuplets, copyrighted by the Scripps-Howard Feature service N E A, have reaped a gold mine of profits, through the sale of the newspaper rights, the magazine rights, and the advertising rights

The cameraman can never predict when in the course of his regular work he may stumble across some such valuable pictoral material, yet it can safely he said that very few photographers or newspaper men know what must be done to protect their best

photos by copyright

The Copyright Law The copyright law of the United States gives the person or the organization complying with it "the exclusive right to print, reprint, publish, copy and vend the copyright work."

Any person entitled thereto by this Act may secure copyright for his work by publication thereof with the notice of Copyright required by this Act, and such notice shall be affixed to each copy thereof published or offered for sale in the United States by authority of the copyright proprietor

The law further provides that two copies of the newspaper containing the published picture shall be "promptly deposited in the copyright office or in the mail addressed to the Register of Copyrights, Washington, District of Columbia"

The fee for registration of a published photograph is \$1 An additional dollar is charged if a certificate of registration is desired

The things to remember concerning the copyrighting of a newphoto are, then (1) the negative and all published copies should show the mark ⑤, on the picture itself (2) The notice of copyright should accompany the published picture each time it appears and should show the year and name of the copyright owner (3) Two copies of the issue of the paper in which the picture is first published should be mailed the Register of Copyrights, together with a fee of \$1

Any new spaper which infringes such a copyright by reproducing the picture is subject to damages, under the law, of not less than \$50 nor more than \$200

Copyrighting Unpublished Photographs Free-lance photographers, commercial photographers, and others may desire to copyright their pictures before they offer them for publication

This may be done, by marking the negative with a ⑤, marking each print offered for sale with the copyright notice, "Copyright 19—, by AB"; and by mailing one print so marked, with a fee of \$1, which in the case of the unpublished picture includes the certificate, to the Register of Copyrights The photographer who obtains a copyright before offering his picture for sale is required to deposit two copies of the paper in which it is first published with the Copyright Bureau

Of course the commercial photographer who is paid for making portrata cannot copyright these unless he obtains a full release from his chent, for, as already explained, the negative belongs to him, but all prints from the negative are the legal property of his chent. If he has obtained such a release, he may secure copyright and may later sell prints to the newspapers

#### A APPLICATION EXERCISES

1 Get five recent copies of five metropolitan newspapers which use pictures extensively

Chp pictures which seem to you in any way unethical, if any

2 If you found any pictures either unethical or in bad taste-if you distinguish between these modifications—could they have been ethically published had the captions been different? If so, rewrite the captions as you think they should have been

3 Suppose a photograph shows four arrested motorcar thieves with the two police officers who brought them in Write a caption for this picture which on publication would make the reproduction both illegal and unethical Now write a caption which would make the publication both legiti

mate and ethical

4 Suppose the governor of your state is campaigning for reelection Assume that the election will be hotly contested, probably close, but that the governor himself and informed circles expect bim to win You get a candid shot of the governor taken late at night after a conference with his campaign manager The governor has his face buried in his hands, probably an attitude of fatigue Comment on the ethical question involved in publishing this picture Write a caption which you believe would make

the publication of this picture entirely ethical

5 Suppose the Junior League of your city will soon produce a benefit play to help needy persons at Thanksgiving An off-stage action to be recounted in dialogue in the play shows the heroine prostrate under the laws of a hon Your publisher considers it in the public interest to publicize this performance. He has a composograph made at the city zoo with the herome and a lion the lion in the cage alone in desired position when one exposure is made, the girl alone in desired position when another exposure is made, the two combined to make a realistic picture, though in reality faked Write a caption for this picture which you think would make its publication ethical

6 Criticism was leveled at newspaper publication of a particular picture of King Edward VIII and Wallis Simpson before Mrs Simpson's divorce The picture showed the two walking along a street, one a little in advance of the other As their arms swung, the camera caught them so that the front view looked as though they were holding hands. A photographer submitting the picture explained the illusion Some American papers published this picture in a way charged to be unethical, others in a way regarded as quite ethical Write a caption for this picture which you believe would have made the publication ethical, and explain what it avoids which the unethical publication probably did not avoid

#### B CHAPTER ORGANIZING QUESTIONS

- 1 Why will police often compel prisoners to face newspaper cameras against the prisoners' will? What migry to prisoners may result? What social good may result for the public? What value may accrue to certain prisoners?
- 2 What courts now bar all photographers? Suppose a photographer takes a picture in a courtroom against court order but unknown to court attachés What may happen?
- 3 Describe three hypothetical cases in which an unfaked photograph might injuriously misrepresent a person or institution

- 4 What particular conditions make some gruesome pictures quite ethical to publish?
- 5 What complicating consideration arises to make it difficult to frame laws to prevent the publication of so-called unethical pictures? Illustrate by specific mixture, either actual or hypothetical
- 6 What legal restrictions are placed upon the use of photographs of people for advertising purposes?
- 7 Wherein and why do these restrictions cease to operate in pictures used for news coverage?
- 8 Illustrate specifically how public taste changes with respect to ethics, conduct, and dress, and with respect to published photographs
- 9 What three kinds of faked photographs are most common in newspaper experience? Explain a method of handling and a social condition which may make a faked preture entirely ethical to publish
  - 10 What faked World War pictures caused diplomatic friction?
- 11 In pictorially reporting the first execution in an American penutentury by shooting, an American paper published a picture poved by a model, in order to show the target fixed in the region of the heart and the electrocardiograph machine ready to make a scientific record. Since an actual photograph of the execution was illegal, was the publication of this posed picture in any conditions ethical?
  - 12 Define libel in pictures
- 13 A Viscousin newspaper was sued for publishing a picture of the wrong woman in a sensational divorce trial, even though the overline and underline hoth correctly named the woman actually involved. The paper received the photograph in good faith with the name of the woman involved in the divorce case correctly written on the back. Was the paper guilty at law? With respect to ethics and newspaper caution what should the paper have done hefore publishing the picture.
- 14 If an innocent person's picture appears in a group photograph with criminals in the news, what two things may the newspaper do, either of which would justify, hoth legally and ethically, the publication?
- 15 What is wrong with a composograph showing an airplane flying over a mountain with the propeller visible?
- 16 Suppose in a later edition a newspaper republishes a libelous picture with a correct and legitimate caption. What effect has this on a libel suit brought against the paner for the first publication?
- 17 How may photographs be copyrighted after publication? Before publication?
- 18 Why is it impracticable to copyright all pictures which a newspaper publishes?
- 19 Suppose a commercial photographer photographs a private citizen for pay for the personal use of his client. The negative by law belongs to the photographer. If the client later figures in news and refuses to give a picture to the paper, may the photographer sell the paper a print from the negative which he owns?
- 20 What precaution do newspapers often take when photographing persons in the newspaper studio for feature section use?

#### CHAPTER XXIII

# THE PICTURE MORGUE, FILING PHOTOS, CUTS, AND FILM

#### PREVIEW QUERIES

Since some photographs or mats coming to a paper from services seem to have little or no value for that paper even in the future, should all of them he filed?

If a smaller paper s hudget will not permit a morgue staff capable of individually classifying all pictures deemed possible of future use, how may the paper retain reasonable access to those regarded as 'probably worthless'?

Suppose a dust-storm or soil-conservation picture were filed under the general topic Agriculture in a new-paper morgue What would happen if an editor wanted the picture again quickly? How may such pictures he efficiently filed and yet retain their logical classification of Agriculture.

Suppose the best pictures you have of certain news figures are in group shots containing other notables. How may you file these photographs so as to make the individuals quickly accessible?

New York water

Suppose you have pictures of various piers on the New York water front and scenes of the Pennsylvania station Under what headings should these he filed?

Should metal cuts he extensively filed in a newspaper morgue? For what reasons and how, should certain negatives he filed?

ANY newspaper which has followed the modern trend toward pictorial reporting is receiving daily, from staff cameramen, from picture services, from local sources, a quantity of photographs, some of which find their way into the day's news columns and some of which do not. Whether they do or not, they represent a cash purchase on the part of the paper which is not to be ignored.

One of the comfortable things about good newsphotos is the fact that their death rate is not so high as that of words. Yesterday's news story will not be republished tomorrow, nor next week, but yesterday's newsphoto may be published again and again over a period of a month, a year, or even years. Some of

the best newsphotos have been run so often that the experienced picture editor is inclined to sigh when he sees his old friends in print again, but he does have to marrel at their longevity

Since the merchandise is valuable, the newspaper should see that it is properly taken eare of and made available quickly when thappens to be needed again. Some newspapers destroy a great many newsphotos to save the expense of filing. Many pictures look as if they never should have been taken or as if they never could be needed again. Often these are the very ones that turn out to be indisensable tomorrow.

The problem of picture filing presents itself with many differ ent aspects, depending on the newspapers themselves If a paper is large and wealthy, and uses a great many newsphotos, it will want to classify and file all of them thus building up a picture morgue that will be its strength in days to come If the paper is small and uses only a limited newsphoto service, it will probably he able to file all the pictures it receives and should do so It is the newspaper which uses a large number of pictures jet is committed to rigid economy in operation, which has the hardest problem Perhaps it does not maintain a morgue staff large enough to cope with the stream of pictures properly They pile up with amazing speed. Would it be better to tear up most of them and keep only the obviously valuable ones? The answer to this question is No Pictures are property which may turn out to have value at any time. They should be kept at least until enough time has expired to make it possible to judge whether they will be wanted again

For the newspaper that must economize, then, the method of filing pictures should (1) Make pictures of obvious value readily available, (2) Retain even pictures of no apparent value so that they may be found if needed or discarded when it is certain that they mill never be wanted again

The picture editor should see that all photos not currently in use flow to the morgue regularly and promptly, instead of being dumped into the morgue at irregular intervals. This will facilitate their proper handling. If the morgue is not equipped to classify all pictures, it should divide the picture stream into valuable and less valuable pictures. The latter (which should include only those for which experience shows there will probably be no call) may be retained in a date file. Each day an envelope

bearing the date is added to this file, containing the "worthless" pictures of that day. If these pictures ever should be needed it will usually be possible to locate them after a hine search

Of course this is a makeshift plan, but it is suggested as an economy measure when all pictures cannot he classified At the end of two years, it will perhaps be safe to withdraw an envelope from the files, glance through its contents, and destroy all but those which have gamed rather than lost value, but certainly it is a hazardous procedure to destroy pictures which have not heen held for this length of time

In the classified picture file, the best rule to follow is Keep it simple. The hest picture file requires no separate card index of any kind as a means of locating its contents. It is a straight alphabetical file, ranging in the same alphabet all persons, places and subjects. As we shall see later, if any of these picture groups, whether of a person, a place, or a subject, must for convenience be subdivided, the classifications in the group are likewise alphabetical. Cross-reference cards the same size as the file envelopes are inserted wherever they seem necessary. In such a file, Agriculture will be found under A, Roosevelt under R Germany under G. If I want a picture of Southern sharecroppers and look in the file under S I will find a reference card saying "See Agriculture Sharecroppers."

It is best to gather together allied subjects rather than to scatter them too widely through the file one in search of pictures for a layout to glance rapidly through enrything there is that is close to his subject. An editor might

for instance, come to the morque looking for a set of preumon "Soll conservation." There might setually be lattle under the particular heading yet under "Drought" might be found preums satted to his needs, and the danger is they might be over wheld unless they happened to fall under the eye of the one glanding havily through the file. If everything remotely associated we he the subject he has in mind is concentrated in so far as possibin a single file-cablest drawer, there is much more chance that he will be allowed to inspect everything the morque has on hand

We have said no card file of such a picture months is necessary, but for the purposes of those who are classifying picture to go into the file one may be very useful indeed. It need not less warquistions, but merely all existing classifications. Some of the large subject group, may occupy an entire drawer or more in the file cabinet, but it will be easier to inspect such a volume of pictures when they are in one spot in the file than if they had to be looked for in many different places.

Of course these large groups will be broken down into subclassifications. Thus a first envelope in the file will contain the more general pretures, followed by an envelope containing patures in each subclassification. Each envelope will bear the general classification and the subclassification clearly at the top, so that there is no difficulty in glaneing through and obtaining what is wanted. To make this clear, let us pull open the p cture file drawer in an actual newspaper morgue and see what we have under Agriculture. Here is a long sense of envelopes, each containing a handful of pictures and each neatly typed with a heading at the top. The envelopes, as we leaf back through them read:

Agriculture: (General)
Agriculture: Auctions
Agriculture: Barnyard scenes
Agriculture: Barnyard scenes
Agriculture: Beltsville, Mid., farm
Agriculture: Contests: Combusking
Agriculture: Contests: Potato picking
Agriculture: Cooperatives
Agriculture: Cooperatives
Agriculture: Cooperatives

It is merely necessary to glance over such a list classifications as this to realize that the problem in t so to divide up a luige volume of pictures that they difficult to sort through, and at the same time keep one spot in the file all pictures that might be related to the editor has to illustrate. To scatter them to var. the morgue or to fail to subdivide them sufficiently without of much of their availability. As a matter of like Great Britain and France will have still larger put han the one just cited. The editor is interested in but field the picture when he wants it, and to find the light.

All persons in the news are carned alphabetically under their names, whether they be foreign dietators local society women notonous criminals or belong to any other extegory which might make them newsworths. When the person lears a relation to some subject in the news in eross reference enriches inserted in the file under that subject referring to the name file. Thus Hitler has n file of his own but n cross reference under various classifications of the ' Germany file When a personal file concerns no midvidual who has high news value, the volume of pictures may become so important that it is necessary to subdivide them to render them more u eful. The first matural subdivision is to place all pictures of the person alone in one envelope and all pictures of him with offers in n second envelops. These envelopes are marked John Doe In her lual and John Doe Groups I ven this simple subdive ion fails in the exe of the really great notables No t picture morgues contain large files on persons appearing constantly in front page news. Take for instance, a file on Franklin D. Roo evelt and glance over the envelopes of rictures They read like this

Roosevelt Franklin D

though \$1 up Micro Propaganda tirplanes Anoston Ancestral Home Art Cellection Assassination Attempt 1933 Assistant Sec v Nava At Arlangton Baseball Openings Chatauoua Chicago Convention Church Congress Constitution Hall Dedications ete

United States presidents are not the only ones whose picture files might assume proportions which required a large number of classifications. Persons who, like the Duke of Windsor, Charles A. Lindbergh, and many others, have been constantly in the news over a long period of years will require careful classification. The older pictures should not be thrown away, for it is precisely these which may frequently lead interest and charm to a layout.

We have seen that individuals are filed alphabetically under their names. This does not, of course, make it impossible to have such general subject classifications as People (meaning types of people rather than individuals); Crime, meaning types of criminals and pictures suited to general feature stories on crime, rather than individual criminals; and, in fact, any other such general headings under which experience may show that requests for pictures are made frequently. If a particular picture seems to be one for which there would be no call under the individual's name but

Ships Officers

Occupations

Unusual

which might serve as a "type, 'it should go in one of these groups, with a cross reference card under the name as a precaution

A People file would show such subclassifications as

•		
Acrobats	Food Tasters	Pygmies

Fiddlers

A general Crime file would contain such subclassifications as

Hatchet Slavings Murders Arson Hex Cases Murder Scenes Bombings Police Round-ups Capital Punishment Hideouts Children Jail Rreaks Prevention Work Tar and Feathers Detection Junes Kidnaping Torture Victims Equipment Firebugs Lie Detector Trail Scenes Violence Floggings Lineur Lynchings Women Gangster Funerals Slavings Mail Robberies Youth Man Hunts Hangings

Cross reference cards will have much to do with determining the usefulness of the alphabetical file. There may be good pictures of skiing under several nations, but a cross reference in the S's will locate them all

It is natural to ask the question whether, since pictures must often be looked for in several places, even in an alphahetical file, it might not be as well to employ some other filing system, together with a card catalogue or index with which to locate them. Some bave advocated filing pictures numerically, that is the last twenty five pictures the morgue acquired would be placed in an envelope capable of holding that number and placed in the file under an accession number. A card would be placed in the index for each picture, with as many cross references as required.

The only thing to be said concerning the numerical file for pictures is that the suspapers which have trued it have found it hopelessly madequate. Consider the plight of the editor who comes to the morgue asking for "the best dozen pictures you have on Roosevelt." We have glumpsed above the amount of material such a name might yield. If each of the hundreds of pictures were in a different part of the file it would take a week to select the best twelve. The plight of the editor seeking a layout on conservation or industry would be as desporate.

It is safe to say that all important newspapers use the alphahetical system for filing pictures today A few use a variant of the alphabetical file, by keeping the pictures of individuals in one alphabet, the pictures of places in another, and the pictures of subjects, such as agriculture or industry, in a third Some liave a completely separate picture morgue of sports, both players and scenes Many of those who began with such systems are own changing over, hecause the greater the volume of oewsphotos and the more frequent the demands that are made for them to the morgue, the more convenient it is found to have everything in a single alphabetical file. Why? Well, as an instance consider what might happen if the city desk (not the sports department) calls up and asks for a photo of John Doe. He is, we may suppose, a featherweight hover, but his name does not happen to be familiar to the morgue employee. Failing to find him in the general file, she may ask the city desk. "What is the story?" "Why, John Doe has just won the sweepstake." Or he may have just hilled his mother-in law. It will take a good deal of precious time and explanation before he is finally located in the separate sports file. In a general alphabetical file, he would have heen spotted at once

Names promine of in sport will be filed like all other pictures of individuals. There will however, be a general subject file for sports in the Ss, containing such subdivisions as Baseball, Baskelball, Bozing, Crews, Cross country Runs, Football, Golf, Horses (the subdivisions under this would list alphabetically pictures of all racchorses), Hunting, Ice Hockey, Ice Skating, Indoor Sports, Jousting, LaCrosse, Marathons, Motorcicling, Mountain Climbing, Olympic Games, Ping Pong, Pole, Racetracks, Stadiums, Tennis, Tilling, Track and Field, Women's Sports, Wrestling

Each foreign country is the subject of a main classification in the alphahetical picture file Under that nation are grouped all subjects and places which heloog with it. Thus the industry of Sweden, the housing projects in Sweden, and the cities and geo graphical landmarks would each take a subclassification under the main head Sweden.

When we come to our own couotry, such a plan has to he discarded, because the great hulk of the pictures the morgue has on file concern something or other in the United States They are filed as we have already ooted, under Agriculture, Crime, or whatever they may concern There will he to the alphabetical file a main classification United States It will prohably show such subdivisions as Army, Navy, Marine Corps Aviation of the strictly military variety may be handled here, if desired Some newspapers have found it better to make Anation one of the maio

classifications in the picture morgue, gathering together under this broad heading all aviation pictures, including commercial aviation, United States government aviation, and foreign aviation, with of course a subclassification for each foreign nation. The reason for doing this is that a great many aviation layouts are used which draw regularly upon all these different groups, and it is therefore found convenient to have them together. No rule should be laid down, but each picture morgue should be governed in matters like this by the run of requests as a general indication of what classifications will prove most useful in the file in special instances.

Each state of the United States can conveniently he a main classification, with places and subjects referring specifically to that state grouped together. In filing pictures by state, care should be taken not to place under the state heading those which belong under general subject headings, such as Apriculture, Industry, etc. Only subjects which would logically be asked for by states should be so classified. We have tried to give enough specific examples to illustrate the problems that arise in filing pictures There is always, of course, the matter of handling a few oversized pictures These require a special large picture file, either a cabinet of shallow drawers or trays, or merely broad shelves close together so that only a small group of pictures is placed on each shelf where they may be readily located As we have seen in some of the listings above, such pictures carry a reference card in the regular file

### PILING CUTS IN THE MORGUE

In addition to pictures, the morgue files a certain number of cuts which may be needed again Most newspapers save (1) all good 1-, 2-, and 3-column cuts of individuals who have any real news value and all cuts in these sizes of local individuals however unimportant they may seem; (2) cuts larger than 3 columns only on very important people, (3) some cuts, other than individuals. for which there may be repeated use, as ehips, cities, major disasters, racehorses

All envelopes in the cut file are 3-column size. They are marked as in the picture file and arranged alphahetically. There is no separate card index and no grouping under subject heads, but only straight alphabetical filing. A few oversized cuts may be kept in a special drawer or cabinet and reference cards inserted in the regular cut file.

Here again, as with pictures, some newspapers have tried and some still prefer a numerical filing of cuts with a card index. The weight of the metal, it is quite true, makes for a little more trouble if the file must be expanded, but normal expansion can be forescen and readily allowed for in planning such a file. Again, the alphabetical filing makes for speed in finding the cuts when called for, and that is a very important item in any morgue

The bulk of the cuts made are not saved The problem of holding onto so much metal would be enormous, and the newspaper could not reprint the same picture layouts often The pictures themselves may be used again, but they are changed in appearance by new croppings, new combinations, new layouts, and, of course, by their reference to new events. The newspaper saves cuts of individuals as "insurance" against the big story that may break close to a deadline. Often, when there is time and a good news include has just come in, a new cut is made in preference to the old one on file in the morgue

Every cut before filing is marked with complete identification on the back. For this an acid ink that is indelible on the metal is used. This is a very important procedure, for the cut, just as the photograph, must be properly identified before its use in the paper or grave dangers of libel may be incurred. As an added precaution in identification, and also to show the editor just how the cut will look in print, a copy of it is cut out of the edition in which it was published and is filed with it in the morrue envelore.

# FILING MATS IN THE MORGUE

Some newspapers make a considerable use of small picture mats furnished by the services. These may be filed right in the envelopes with the newsphotos, if desired. A proof should accompany the mat as identification and the mat itself should also he identified on the back, in a margin or clear space, taking care not to injure it in so doing

Different morgues use different methods of charging pictures out to editors and employees of the newspaper Whatever method is followed, it is important to see that all pictures are returned to the files. If pictures must be multilated, as in cutting them up for a pastedown layout or photomontage, they should go first to the photographic department to be copied, and the copy, rather than the original, should he used. If the photograph was made by a staff photographer, then the studio will be able to print a duplicate from the original negative, leaving one copy in the morgue file. Unless there is great supervision of this matter, many valuable newsphotos will be drained out of the morgue files, never to be replaced or duplicated.

A simple plan is to keep a daily sheet on which is recorded every picture lent, under its classifications, followed by the name of the borrower, the department of the newspaper, and the date on which it may be expected to appear in the paper. A large hox is kept in the composing room, next to the cut bank, with a lock to which only the morgue has the key. The hd of this hox has a large slit to allow pictures to be dropped into it. When pictures are delivered to the cut bank from the engraving plant, along with the cuts, they are deposted in this box as soon as the printer has completed his verifications. A morgue employee collects them each day and checks them off the lists of pictures still unreturned Back lists are checked over each day by the morgue, and pictures which have not returned after their publication, or which did not appear on the date expected, are inquired about at the proper department.

# FILING NEGATIVES OF NEWSPHOTOS

The photographic studio usually keeps its own file of negatives of all pictures made by the staff cameramen. These negatives are seldom called for, after the first pinting, since the print is on file in the morgue. They therefore do not require filing in a manner which makes for great speed in constant handling, as is true of pictures. Nevertheless, there will be an occasional call for an additional print from a negative

The most convenient filing system for negatives is the numerical Each negative has a number scratched on it. The day's

erop of negatives can be stored away on shelves in the boxes in which the film was purchased, each box containing about 25 negatives. The numbers of these would be marked on the end of the box so they could be easily read, as "No 125 to 150'

Some of the larger papers go to much more trouble to file their negatives, placing each one in a cellophane envelope and filing them in drawers. The negative and envelope bear the number, and the film may be examined through the envelope without withdrawing it or possibly damaging it. In any case, it is necessary to keep an alphabetical card file of negatives, by names of people, subjects, and places, and with a certain number of cross-reference cards. Each card bears the number of the negative, by which it may be located.

#### A APPLICATION EXERCISES

1 Obtain two copies of different Sunday newspapers which use many pictures. Olip all the pictures and their overlines. Assume these pictures are prints or mats. For identification, number these pictures consecutively. On copy paper, indicate opposite the numeral for each picture the classification label on the morgue envelope in which you file each picture, indicating cross-reference gards where needed.

2 Select from these pictures the 23 per cent which you think are least apt to be used again by these papers. For each of three of this less valuable 20 per cent, write our 1 slogical imaginary case in which a story or feature might develop which would call for a reprinting of the picture or part of the picture. Explain how you would file this less valuable group in case the Deber could not afford to classify each pint individually.

## B CHAPTER ORGANIZING QUESTIONS

1 Suppose your newspaper as a sub-metropolitan duly attented in a town which has no distributing office of a news neture agency and that therefore your nonlocal pictures come in mat form from the NEA syndicate at Cleveland, Ohio, 600 miles from your town. You wish to preserve the mais as you would prints, yet your budget will not permit classifying each one individually nor a long distance telephone call for information on previously dirashled mats. What aimple system might be devised for filing these mats in two groups of "Probably Usable Agam" to be classified individually, and "Probably Vorthless" to be retained for two years?

2 Many small newspapers which preserve picture prints and mats at all deliver them from copy desk or pressroom once a week, or less frequently, to the morque to be filled Comment on this practice

3 How often should pictures or mats be culled out?

4 Comment on the use of a card index for a classified picture file

5 Suppose you have several pictures or mats of experiments with growing corn in chemicals without soil to determine facts about soil nutrition. These

conceivably could be filed under such headings as these Science Experiments Soil Nutrition, Agriculture Experiment Sation Corn Chemical Nutriment, Chemical Lee Aprime object in any morpic classification is to use a psychological approach which will file an item under a heading which is apt to occur to an editor looking for the item months or years after it has been catalogued Explain where you might file these corn pictures, and how you would then insure their being quickly traceable through the headings indicated

- 6 What is a helpful policy with respect to grouping certain topics in a single file drawer?
- 7 Suppose you have prints or mats of charts showing the effect of the 1934 drought on principal farm products in your trade area. Under what classification would you file them?
- 8 How would you file pictures of termite damage and pictures of the application of methods for providing against termite infestation in farm buildings?
- 9 Pictures relating to Great Britain obviously would hulk large in any morgue. How would you provide against pictures hecoming "lost ' under the too large heading Great Britain".
- 10 Suppose you have photographs of the present governor of your state taken alone, also photographs of hum in groups with members of his family, members of his personal staff at the state capital, members of his graduating class at the Harvard Law School Conceivably, you might wish to get your hands on one or all of these pictures quickly. How would you file them so as to make this possible without burying the other figures in the groups or without burying nuctures of the governor alone?

### GLOSSARY

- Additive color process The production of colored images by actual addition of the primary light colors, i.e., by superimposition of light, or, what is visually similar, hy juxtaposition of minute adjacent areas of the various primaries
- Arrbrush An air-operated apparatus for the purpose of shooting a fine even
- Autochrome A color transparency plate of the additive type which antedates other existing direct color emulsions
- Balance Equilibrium between the visual factors of which a layout is composed. Such equilibrium may be active, in which case it is termed asymmetric, it may be static, in which case it is called symmetric.
- Ben Day A copy ighted process taking its name from the inventor, by means of which dot patterns recembing halftone and other designs may be timpsferred to metal and etched to give a relief printing surface
- Bite The depth of erosion caused on a metal plate by the action of the etching acid
- Black letter Bold or heavy Gothic type used in Germany
- Camera lucida An instrument used to project an enlarged or reduced image of a picture or photo onto a sheet of paper
- Candid camera There is no such thing for candid is a term used to describe
  a type of picture which can be and has been taken with any kind of
  camera Candid is a recognized term meaning "animated" por
- traiture

  Caption A briefly worded explanation accompanying a printed picture
- Carbro A subtractive color printing process using bichmmated gelatin images superimposed
- Casting See stereotyping and casting
- Characteristic curve A graphic representation of the growth of density of an emulsion with increase in exposure
- Chromatone A subtractive color printing process using toned and superimposed film positives
- Circle of confusion The diameter of a minute circle or dot which is arbitra rily considered visible only as a point to the eye at some predetermined viewing distance this disameter may vary, depending upon whether the image is to be viewed small or as an enlargement, from, say, Mon in or less
- Cold top The coating sensitive to light, with which a sheet of metal is treated by the engraver so that a photographic negative may be printed upon it, as on a sheet of photographic paper
- Contact printing Printing by means of direct contact hetween the negative and the positive printing material

- Contrast The quality of relative brilliance of a photographic image. A negative with a great range of tones has much contrast. The term used in this way is roughly synonymous with "gamma." Contrast in a print is more often meant as a measure of apparent brilliance rather than actual range of tones. A contrasty print is one with many black and white tones, a paucity of gray tones.
- Content Subject matter of the newsphoto, as distinguished from its photographic qualities or reproduction values
- Continuity A layout of pictures showing a progressive sequence
- Copy value Reproduction value of the newsphoto, from the standpoint of engraving and the printing processes to which it will be subjected
- Crop To mark off a portion of a photographic print, in order to indicate to the engraver what part of the whole picture is to be included in the halftone
- Cuttines Synonymous with captions May refer to overline, underlines, or to lines printed at one side of the picture
- Cut bank The desk or counter in the composing room where cuts are received and hased, assembled with their cuttines and distributed to the makeup men as needed to complete pages. The cut hank should have racks or storage space for cuts which must be held for several days.
- Cutout A figure in halltone from which all background has been removed Density A term used to indicate the actual amount of silver deposit on a sensitive surface Technically it is the amount of "light-stopping sub-
- sensitive surface Technically it is the amount of "light-stopping substance in the silver deposit" and is the logarithm of the opacity when opacity is considered as the resistance of a substance to the passage of light

  Desth of focus (Depth of field, more accurately) A term used to describe
- the hypothetical "number" of planes at varying distances from the camera which are in apparent focus. Thus, theoretically only one plane is in focus at a time, but to the eye objects both nearer the camera and further from it may appear to be in sharp focus, this distance from near to far object is known as the depth of field or depth of focus. It is, of course, a variable depending on the criteria established as visual "sharpness". The process of dysine films but hefers or divine develop-
- Desensitizing The process of dyeing films just before or during development to render them relatively insensitive to light of printing intensity in order that they may be developed by impection
- Disphragm A metal iris aperture of continuously variable size used to control the volume of light entering a lens as well as the effective relative size of the lens opening
- Doctor blade Knife-edged blade which scrapes the excess ink off the surface of the copper cylinder in rotogravure printing
- Dodging Varying the amount of light reaching certain portions of the printing surface—contact or projection printing—to compensate for undesired densities of tone in the original negative Double printing A photoengraving process by which black lettering is
- ohtained on the light background of a halitone. The halitone negative is first printed on the metal, which is then reexposed to light in a contact

frame under a negative line film of the lettering in exact position and with sufficient area of black surface to mask all parts of the metal except where the letters are to be printed. White lettering on a dark balltone is obtained by atripping the positive line film of the letters onto the halftone film before printing takes place.

Dropout A high light background area or other portion of a balltone which is rendered in pure white instead of abowing a dot pattern caused by the

halftone screen

Dufay A color transparency film of the additive type

Durmy A sheet of paper on which a layout is executed A newspaper page dummy, though small, will have the same proportions as the newspaper page, is ruled for columns, and usually has numbers on the side to indicate measurements in lines of type

Exposure The term used when speaking of the amount of light received by

a photographic emulsion

Finlay A color transparency plate of the additive type, differing from most "direct color" film and plate materials in that innumerable positive color transparencies may be printed from the taking negative, instead of the original negative being reversed to produce a single color transparency

Fizing The process of removing from developed emulsions the unexposed

silver halides

"F" number A pure number (a ratio) used to measure the relative size of the lens aperture and consequently the relative speeds of lenses It is the ratio of the diameter of the lens opening to its focal length

Focal length The distance from an optical point or plane, usually lying within a lens to the point at which parallel entering beht rays emerge

as convergent rays coming to a focus or point

Fog A uniforo deposit of silver on an emulsion which partially or entirely obscures the regular photographic image. It may be caused by stray light or it may occur oberoseally or electrically

Format The shape and size of the newspaper page, or any page

Gamma The relation "of the density range of the negative to the range of the logarithms of the exposures producing them" It is an abstract number, a ratio, measuring the contrastmess of a negative which has received a theoretically correct exposure

A gamma of 1 0 indicates that the negative would transmit a range of light intensities exactly proportional to those of the original photographed

Glossy A photographic print on white gloss paper

Gothic A classical type face showing uniform strokes

Halltone The process of breaking up the continuous tones of a photograph or wash drawing so that these tones may be transferred to metal and etched to give a printing surface. The breaking up is accomplished by rephotographing the meture through a halltone screen.

Halftone cut A metal reproduction of a continuous tone picture, with a

relief printing surface in dot formation

Hypersensitizing A process employed to increase film speed, applied either shortly before, or after, exposure, the increase in speed does not last

- long and so either exposure or development—depending on the particular process used-must occur close in time to the hypersensitizing Insert A picture to he inserted by the engraver in a space indicated for it
- in the layout furnished him Intaglio A photoengraving process which results in a metal printing surface which holds the ink in minute cups or depressions
- Intensification The process of huilding up added density on a developed silver image, because of insufficient image density
- Jump The continuation of a story from the page on which it began to some other page of the paper. The headline used on the continued portion is referred to as a "iump head"
- Kodachrome A color transparency film in which the three superimposed taking images-three thin layers stripped onto one film support-are reversed and dyed subtractively in their respective minus colors (without, of course being removed from the celluloid film base)
- Layout A plan of display for pictorial or printed matter or both
- Lane cut A metal reproduction of a line drawing or other picture without continuous tones Such a cut has a relief printing curface produced by etching
- Lathographic pencil Very soft pencil used by newspaper artists to put crop marks on the face of photographs These marks may be readily rubbed off without injuring the print
- Latitude A term used to express the degree of error permissible in exposure to achieve a usable exposure, the working exposure range of the emul eion, in other words
- Makeup Assemblage by the printer of the metal type slugs, cuts, and other material, in the arrangement in which they are to appear in the printed page or advertisement. The word is also widely used to refer to the refinements of makeup which the printer can supply
- Mask A cellophane covering, painted so as to block out certain portions of a picture which is to be copied in the engraver's camera
- Masthead Statement of the newspaper's ownership, as required by postal regulations Usually a small block of type on the editorial page, with the paper's name at the top, followed by names of owner, officers, press association affiliations, subscription price
- Minus colors (As, minus red ) In primary colors, the color sensation of the two remaining colors, the minus color not being present. Thus, minus blue = red & green, which produces a color sensation of vellow to the eve
- Mortise A space or hole cutting into the general surface or outline of a picture or a cut Such a hole may be used for cutlines or other type or
- it may allow for the close joining and fitting of one picture with another Nameplate Also called the "flag" The name of the newspaper, as it appears in a characteristic type face and style, on the front page and on the first pages of additional sections
- Orthochromatic Sensitive to all spectrum colors from ultraviolet and blue through green and some yellow, hut not to the red hues

- Overline A special caption printed over the picture, as a heading, in larger type
- Panehromatic Sensitive to all colors of the visible spectrum
- Pastedown A picture layout in which the newsphotos are pasted in their exact positions on a sheet of white Bristol board
- Photomonlage A picture layout combining and blending several photos to create a single impression
- Polaroid filter A thin flat piece of glass enclosing rounite crystals which transmit only polarized light. Since much reflected light is polarized, a polarizer removes some reflections and glare.
- Primaries The three primary colors—colored light as distinct from "colored' pigment—which cannot be produced from any other colors but which in combination can produce any other colors
- Print A positive image from a photographic negative A tronsparency is of course a form of print
- Process camera The engrover's camera, specially designed and equipped for producing the negatives used in photoengraving
- Process film A film of very high controst, or gamma, used for subjects like copying work which have only a short light-scale range
- Projection printing Printing by prajection of the light image from the negative upon the printing surface with a lens, the reverse, as it were, of the picture-taking process, the negative image being projected out thraugh the camera onto a sensitized paper.
- Reduction The pracess of removing silver from a photographic emulsion after development because of too great density
- Reflex camera A camera with an interior mirror to intercept the light image and project it upon an extra ground glass atop the camera Just before exposure the rairor awangs clear of the path of the light, or in some roiniature reflexes, a separate lens system is employed for the mirror and top ground class plane
- Retouching Any work done on a negative or photographic print to imprave
  its copy value se, the detail tone contrast, or other characteristics
  which will affect its reproduction
- Recersal A process which reverses the tones of a silver image black for white and white for black, by menus of blacking the developed image and redevelopment of the remanung silver halide
- Rotogravure A picture supplement printed on rotary presses by means of copper or copperplated cylinders etched in intaglio
- Routing Removing excess metal from a photoengraved cut, by means of a revolving cutting tool
- Run-in sidehead The initial words of the underlines or picture caption set in holder type. They may be the first two or three words of the sentence or roay constitute a eatch phrase at the beginning.
- Sans serif Letters which have no cross-stroke endings Modern type faces with uniform strokes and without serifs
- Scale To determine what the final dimensions of a picture will be after enlargement or reduction

- Screen A device used in the engraver's eamers to break up the continuous tones of a photo or other picture. The halftone series consists of opaque lines ruled on glass crossing each other at right angles and producing apertures through which the light from the original picture must pass to the new negative. Lines per inch vary from 50 to 300, for newspaper work 65 is usual. The integlo screen, used for rotogravure, is a positive series, with clear nilmas semantame opaque sources.
- Serif A cross-stroke termination on a letter
- Showcard colors Opaque water colors used in tones of gray for retouching newsphotos Also known as Miller's Grays
- Shutter A mechanical device meorporated in, or attachable to a camera for opening and closing in order to expose the film
- Two commonest types Between-the-lens, metal blades in or next the lens, focal plane, metal or cloth curtain with variable slots, or one variable aperture, which travels past the film
- Stithouette A figure in halttone, most of which appears against a pure white hackground If the figure is independent of any background, it is called a cutout
- Sluy Key word written on photos, orders for halftones, page dummics, and cuttines, to aid in identifying and assembling material. The word may also rafer to the metal slugs or leads used by the printer to space out lines of type, while a type slug is a metal slug showing letters in rehef
- Speed gun À device attached to the camera consisting of a mechanical or electric abutter tripper and a battery and photofiash lamp accket It opens the abutter and fishes the flash lamp ayactronously with the shutter, thereby allowing instantaneous or action exposure and ependent of external litumination sources
- Split page The first page of the second section of a daily new apaper
- Stereotyping and casting In newspaper parlance stereotyping refers only to the making of the stereotype mat. Paper match is forced into the type page to produce a mold, into which motten type metal is flowed in a casting hox to produce the curved plate which fits onto the press cylinder. The second part of this process is referred to as "casting the plate".
  - Stepples Any mode of shading by separate touches, such as dots, dashes, or short lines Stippling may be done by the artist on an original drawing or may be produced by an engrayung technique
- Streamline head A less formal modern headline consisting of several lines of type of unequal lengths, each set flush left, leaving white space on the right
- Strip film A paper-backed roll of film used by the engraver in his process camera. The film, which is of firm consistency, separates from the paper during the developing stage and is ready to be stripped onto glass for printing on metal.
- Subtractive color process The production of colored images by the subtraction of color from white employing pigments or dyes complementary to the primaries to absorb high progressively from white, leaving only the desired colors reflected from the original white (all-color) surface

- Telephoto lens A lens which gives an image larger than that produced by an ordinary lens of the same apparent focal length, in other words, one which gives a larger image than an ordinary lens when both are in focus and both at the same actual distance from the film
- Tint block A metal cut, showing a homogeneous dot structure, used for surprinting a color over a picture printed in black.
- Transparency A photographic image viewed by transmitted light, light coming through the material rather than reflected from it as with a paper surface. A photographic negative is a transparency but the term is used chiefly when speaking of positive images.
- Type face An alphabet showing a characteristic design, such as Caslon, Gothic, Old English, etc
- Type family A group of closely related type faces
- Type-high Having the same height as the metal type slugs used in making up the newspaper page
- Underculting Action of the etching acid in cutting in under a protected surface on the metal
- Underlines The part of the picture caption which appears beneath it, usually in small type
- View camera A camera primarily for use on a tripod, employing the ground glass for focusing and view finding
- Wesh-off relief A subtractive color printing process using hichromated gelatin printing matrices—which allow easy printing of duplicate color prints—in which the exposed halled of the gelatin emulsion is rendered insoluble in warm water. Photographic density variation of the print is thereby converted to presence or absence of gelatin deposit, which absorbs and prints dye in proportion to its amount.
- Wide-angle lens A lens which subtends a wide angle of view, a lens including an angle of view of ahout 70 deg to 80 deg or over would be classified as a wide-angle lens.
- Il srephoto The Associated Press copyrighted trade name for a newsphoto transferred to a distant point by telephone wires. The transfer is effected by reflecting innuite portions of the surface of the photo into a photoelectric cell, which converts the light into electrical impulsions. Other large news services now transmit photos by such a process, using the designation "wired photos".
